NEW! ROBOTPRO® NX PC-BASED EXPERT SYSTEM SOFTWARE FACILITATES ROBOT MAINTENANCE, TROUBLESHOOTING AND REPAIR

Dayton, Ohio — RobotPro® NX, designed exclusively for use with Motoman robots, provides a comprehensive PC-based expert system for performing robot preventive maintenance, alarm-code troubleshooting and repair procedures. This new version software is specific to robot models that use the Motoman NX100 and NXC100 controllers. It runs in a Windows® 2000 or XP environment on an IBM-compatible PC. RobotPro NX is split into three parts: Procedures, Maintenance and Troubleshooting -- sold individually or together as a suite.

RobotPro NX includes descriptive test and repair procedures with illustrative graphics. It provides a preventive maintenance schedule with links to procedures. The maintenance schedule can be exported to your plant's own ERP (Enterprise Resource Planning) or EAM (Enterprise Asset Management) systems.

RobotPro NX also includes interactive troubleshooting (series of questions used to determine cause of problem) and diagnostic information for more than 300 alarm codes. RobotPro NX helps to pinpoint the cause of an alarm and then prompts the user through the steps necessary to correct it, minimizing robot downtime.

For repair procedures, RobotPro NX includes step-by-step instructions, photographs, drawings, and schematics for motor replacement, lubrication, servo pack replacement, and fuse replacement. It also includes wiring diagrams, exploded parts views; part numbers, and spare parts lists.

RobotPro NX software is tailored to each robot model and structured in a user-friendly, format. When installed on a lap-top computer, RobotPro NX is portable, providing readily accessible information, even at the robot work station.
