FS100 OPTIONS
INSTRUCTIONS
FOR CONVEYOR SYNCHRONIZED FUNCTION

Upon receipt of the product and prior to initial operation, read these instructions thoroughly, and retain for future reference.

MOTOMAN INSTRUCTIONS
MOTOMAN-□□□ INSTRUCTIONS
FS100 INSTRUCTIONS
FS100 OPERATOR’S MANUAL
FS100 MAINTENANCE MANUAL

The FS100 operator’s manual above corresponds to specific usage. Be sure to use the appropriate manual.

Part Number: 161365-1CD
Revision: 0
MANDATORY

- This manual explains the conveyor synchronized function of the FS100 system. Read this manual carefully and be sure to understand its contents before handling the FS100.
- General items related to safety are listed in Chapter 1: Safety of the FS100 Instructions. To ensure correct and safe operation, carefully read the FS100 Instructions before reading this manual.

CAUTION

- Some drawings in this manual are shown with the protective covers or shields removed for clarity. Be sure all covers and shields are replaced before operating this product.
- The drawings and photos in this manual are representative examples and differences may exist between them and the delivered product.
- YASKAWA may modify this model without notice when necessary due to product improvements, modifications, or changes in specifications.
- If such modification is made, the manual number will also be revised.
- If your copy of the manual is damaged or lost, contact a YASKAWA representative to order a new copy. The representatives are listed on the back cover. Be sure to tell the representative the manual number listed on the front cover.
- YASKAWA is not responsible for incidents arising from unauthorized modification of its products. Unauthorized modification voids your product’s warranty.
Notes for Safe Operation

Read this manual carefully before installation, operation, maintenance, or inspection of the FS100.

In this manual, the Notes for Safe Operation are classified as “WARNING”, “CAUTION”, “MANDATORY”, or “PROHIBITED”.

**WARNING**
Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury to personnel.

**CAUTION**
Indicates a potentially hazardous situation which, if not avoided, could result in minor or moderate injury to personnel and damage to equipment. It may also be used to alert against unsafe practices.

**MANDATORY**
Always be sure to follow explicitly the items listed under this heading.

**PROHIBITED**
Must never be performed.

Even items described as “CAUTION” may result in a serious accident in some situations.

At any rate, be sure to follow these important items.

**NOTE**
To ensure safe and efficient operation at all times, be sure to follow all instructions, even if not designated as “CAUTION” and “WARNING”.
WARNING

• Before operating the manipulator, check that servo power is turned OFF when the emergency stop button on the programming pendant is pressed. When the servo power is turned OFF, the SERVO ON LED on the programing pendant is turned OFF.

Injury or damage to machinery may result if the emergency stop circuit cannot stop the manipulator during an emergency. The manipulator should not be used if the emergency stop button does not function.

Fig.: Emergency Stop Button

• In the case of not using the programming pendant, be sure to supply the emergency stop button on the equipment. Then before operating the manipulator, check to be sure that the servo power is turned OFF by pressing the emergency stop button. Connect the external emergency stop button to the 5-6 pin and 16-17 pin of the robot system signal connector (CN2).

• Upon shipment of the FS100, this signal is connected by a jumper cable in the dummy connector. To use the signal, make sure to supply a new connector, and then input it.

If the signal is input with the jumper cable connected, it does not function, which may result in personal injury or equipment damage.

• Once the emergency stop button is released, clear the cell of all items which could interfere with the operation of the manipulator. Then turn the servo power ON.

Injury may result from unintentional or unexpected manipulator motion.

Fig.: Release of Emergency Stop Button

• Observe the following precautions when performing teaching operations within the manipulator’s operating range:
  – View the manipulator from the front whenever possible.
  – Always follow the predetermined operating procedure.
  – Ensure that you have a safe place to retreat in case of emergency.

Improper or unintended manipulator operation may result in injury.
Definition of Terms Used Often in This Manual

The MOTOMAN is the YASKAWA industrial robot product.

The MOTOMAN usually consists of the manipulator, the FS100 controller, manipulator cables, the FS100 programming pendant (optional), and the FS100 programming pendant dummy connector (optional).

In this manual, the equipment is designated as follows:

<table>
<thead>
<tr>
<th>Equipment</th>
<th>Manual Designation</th>
</tr>
</thead>
<tbody>
<tr>
<td>FS100 controller</td>
<td>FS100</td>
</tr>
<tr>
<td>FS100 programming pendant</td>
<td>Programming pendant</td>
</tr>
<tr>
<td>Cable between the manipulator and the controller</td>
<td>Manipulator Cable</td>
</tr>
<tr>
<td>FS100 programming pendant dummy connector</td>
<td>Programming pendant dummy connector</td>
</tr>
</tbody>
</table>
Descriptions of the programming pendant keys, buttons, and displays are shown as follows:

<table>
<thead>
<tr>
<th>Equipment</th>
<th>Manual Designation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Programming Pendant</td>
<td></td>
</tr>
<tr>
<td>Character Keys</td>
<td>The keys which have characters printed on them are denoted with [ ]. ex. [ENTER]</td>
</tr>
<tr>
<td>Symbol Keys</td>
<td>The keys which have a symbol printed on them are not denoted with [ ] but depicted with a small picture. ex. PAGE key</td>
</tr>
<tr>
<td></td>
<td>The Cursor is an exception, and a picture is not shown.</td>
</tr>
<tr>
<td>Axis Keys</td>
<td>“Axis Keys” and “Numeric Keys” are generic names for the keys for axis operation and number input.</td>
</tr>
<tr>
<td>Numeric Keys</td>
<td></td>
</tr>
<tr>
<td>Keys pressed simultaneously</td>
<td>When two keys are to be pressed simultaneously, the keys are shown with a “+” sign between them, ex. SHIFT key +COORD key</td>
</tr>
<tr>
<td>Mode Key</td>
<td>Three kinds of modes that can be selected by the mode key are denoted as follows: REMOTE, PLAY, or TEACH</td>
</tr>
</tbody>
</table>
| Button                    | Three buttons on the upper side of the programming pendant are denoted as follows: HOLD button
|                           | START button                                                                       |
|                           | EMERGENCY STOP button                                                               |
| Displays                  | The menu displayed in the programming pendant is denoted with { }. ex. {JOB}         |
| PC Keyboard               | The name of the key is denoted ex. Ctrl key on the keyboard                          |

**Description of the Operation Procedure**

In the explanation of the operation procedure, the expression “Select • • • ” means that the cursor is moved to the object item and the SELECT key is pressed, or that the item is directly selected by touching the screen.

**Registered Trademark**

In this manual, names of companies, corporations, or products are trademarks, registered trademarks, or brand names for each company or corporation. The indications of (R) and TM are omitted.

1 Conveyor Synchronized Function

1.1 System Configuration Example

A basic system configuration example using FS100 conveyor synchronized function is shown below.

The manipulator detects the conveyor moving amount by the encoder mounted on the conveyor.

Fig. 1-1: System Configuration Example for Conveyor Synchronized Operation
1.2 Conveyor Synchronized Operation

The position tracking type conveyor synchronized operation function modifies the taught path in conveyor non-moving state according to the conveyor moving amount so that the manipulator performs follow-up motion in the conveyor moving direction with constant speed relative to the workpiece.

For example, as shown in fig. 1-2(a), teach P1 to P7 (P2 to P6 are the points in synchronization) with the conveyor stopped. In playback operation, the manipulator follows the conveyor (workpiece) with the motion path modified in the conveyor moving direction as shown in fig. 1-2(b).

The conveyor synchronized function can use either the manipulator base axis or the traveling axis (external axis) to follow the movement of conveyor. However, the base axis and the traveling axis can not be selected simultaneously.

*Fig. 1-2(a): Teaching*

*Fig. 1-2(b): Synchronized Motion Path in Playback Mode*
1.2.1 Conveyor Home-position Limit Switch

The conveyor home-position limit switch turns ON the conveyor home-position input signal when a workpiece is detected by a sensor.

1.2.2 Conveyor Home-position Input Signal

When the conveyor home-position input signal is input, the conveyor current value is automatically reset to 0 mm.

Then, the manipulator can enter synchronized operation status by execution of SYSTART instruction.

1.2.3 SYSTART Instruction and Manipulator Motion

The SYSTART is a conveyor synchronized operation start instruction.

Format: SYSTART CV#(1) <STP= Synchronization start position (units: mm)>

After having executed the SYSTART instruction, when the conveyor reaches the position specified at STP as the synchronization start position, the manipulator enters the synchronized operation status. Up to this moment, the manipulator does not move.

When a workpiece reaches the position set as the synchronization start position, the manipulator starts the synchronized operation.

(The distance to the synchronization start point)
If the SYSTART instruction is executed before the input of conveyor home-position input signal, the manipulator waits until the conveyor home-position input signal is input and the conveyor reaches the synchronization start position, then starts the synchronized operation.

If the conveyor home-position input signal is input before the execution of SYSTART instruction, the manipulator waits until the conveyor reaches the synchronization start position, then enters in synchronized operation status.

1.3 Conveyor

1.3.1 Conveyor Form

There are three types of the conveyor tracking motion: robot-axis tracking, base-axis tracking, and circular tracking.

Each type must be set according to its system configuration (tracking motion type).
1.3.2 Definition of Conveyor Moving Direction

The conveyor moving amount pulses detected by the encoder mounted on the conveyor are scalar. From this number of pulses, the manipulator determines how far to move, but not in which direction. Therefore, the conveyor moving direction must be defined for the manipulator. For the definition of moving direction, a user coordinate is used. (Refer to “TRACKING (ROBOT-AXIS/BASE-AXIS/CIRCULAR) at page 4-4”.)

1.3.3 Conveyor Distance for Follow-up

With the conveyor synchronized function of FS100, a manipulator can synchronize a conveyor continuously over a maximum distance of 21 m within the manipulator working envelop.

Since the distance more than 21 m can not be processed internally, if the moving distance reaches 21 m during synchronized operation, the alarm 5022 “CONVEYOR POSITION LIMIT” occurs and the manipulator stops disregarding the succeeding synchronization.

1.3.4 Measurement of Conveyor Moving Amount

How far the conveyor has moved from the conveyor home-position is measured by the cumulative number of feedback pulses from the encoder mounted on the conveyor. The accumulation starts when the conveyor home-position limit switch is turned ON. At the start, the cumulative amount is zero (0).
2 Hardware Specifications

This chapter explains the required equipment and boards to use the conveyor synchronized function, as well as what data are required and how they should be set. Before setting up a system, read carefully this chapter.

2.1 Required Boards and Setup

For the conveyor synchronized function, the counter module board CNTR-01R is required besides the standard boards.)

Up to two conveyor encoders can be connected to a single CNTR-01R board.

2.2 Connecting CNTR-01R Board to FS100

2.3 Connecting Conveyor Home-Position Signals to FS100

Since the conveyor home-position input signals are used for the reference to the conveyor position, they must be as in phase as possible. It is recommended to connect the conveyor home position signal from the conveyor home-position limit switch directly to the FS100 so as to eliminate dispersion caused by sequencer scan time errors.

When using a sensor as a conveyor home-position input signal, install the following wirings in accordance with the type of the sensor.

*Fig. 2-4: A). NPN Type*

```
+-----------------+  CNTR-01R board
|                 |  CN1-39 (24V)

|                     |  CN1-40 (LS2)

(Prepared by the user)
```
2.4 Applicable Encoder and Connecting Specification

For the FS100 conveyor synchronized function, use a conveyor encoder with two-phase line driver outputs (equivalent to RS422). Encoders with open-collector output or signal-phase output are not applicable.

The connection of encoder to the CNTR-01R board is as shown below. Check if the encoder operates correctly on the conveyor position window explained later.

For 5 V encoder with line driver, PREA-3C□□□□□□ manufactured by Yaskawa Control is recommended.

2.5 Detecting Encoder Cable Disconnection

With the conveyor synchronized function, at disconnection of encoder cable, the alarm 1400 “ENCODER ERROR (CONVEYOR)” occurs and the servo power supply is shut down.
3 Connector Connection

1. Remove the cover for I/F cable on the front.

2. Connect the cable to the connectors on CNTR-01R board.
3. Re-install the cover.

**NOTE** Be sure to securely tighten the connectors with a screwdriver.
4 Settings for Conveyor Condition File

4.1 Conveyor Condition File

For proper operation of conveyor synchronized function, the data of conveyor must be provided to the FS100 by setting them in the conveyor condition files.

There are six conveyor condition files from File No. 1 to 6. Up to six files can be used for each CNTR-01R (Type: JAPMC-PL2300R-E) board for conveyor synchronized operation. In the system with one CNTR-01R (Type: JAPMC-PL2300R-E) board, up to six files from File No. 1 to 6 can be set and two encoders can be used. Also, if three CNTR-01R (Type: JAPMC-PL2300R-E) boards are used, up to six files from File No. 1 to 6 can be set and six encoders can be used.

\end{center}

\text{CORRECTION (FORWARD/REVERSE)} \text{ Specify whether to reverse the synchronized direction or not. When “REVERSE” is selected, the sign of correction position on the conveyor speed window is inverted and the manipulator synchronizes in the reverse direction.}

\begin{center}
\includegraphics[width=0.5\textwidth]{correction_forward_reverse.png}
\end{center}

When "BASE AXIS" (explained in the item 6) is selected for "TRACKING"
TRACKING (ROBOT-AXIS/BASE-AXIS/CIRCULAR)

Specify whether to carry out the synchronization with the robot-axis or the base-axis (servo track).

If “BASE AXIS” is selected for the system without base axis, no synchronized motion can be performed.

Robot axis: Teach three points as P1, P2 and P3 on the conveyor as reference points of user coordinate as shown in the figure below. Set the X-axis of user coordinate to the conveyor moving direction.

Register these user coordinates in “USER COORD NO.” of the conveyor condition file so that the manipulator synchronizing direction is the conveyor moving direction.

- For registration of user coordinates, refer to "FS100 INSTRUCTIONS".
- For details of circular tacking, refer to chapter 9 “Turntable Synchronized Function” at page 9-1.

![Diagram showing conveyor moving direction, robot coordinate X-axis, Y-axis, and points P1, P2, P3.](image)

ORG: User coordinate home position
XX: Point to define user coordinate X-axis
XY: Point to define user coordinate Y-axis
Base axis: Select a base axis (servo track) among X, Y, or Z-axis, which is parallel to the conveyor. In this case, the conveyor moving direction does not need to be defined in a user coordinate. The relations of the base axis, X, Y and Z, the conveyor, and the robot coordinate axis are shown below.

**When Synchronized by Servo Track X-axis**

**When Synchronized by Servo Track Y-axis**

**When Synchronized by Traveling Axis Z-axis**
5 USER COORD NO. (1 to 16)
When “ROBOT AXIS” is selected in ⑤, specify with which X-axis direction of user coordinate is to be carried out for the synchronization by selecting the user coordinate number.

⑥ BASE AXIS (X/Y/Z)
When “BASE AXIS” is selected in ⑥, specify with which base axis the manipulator is to be synchronized among X, Y, or Z-axis.

⑦ POSITIONAL RESOLUTION (0.01 to 999.99 μm)
The data for converting 1 pulse from encoder to the conveyor moving amount (μm). For details of setting method, refer to chapter 4.3 “Setting Conveyor Positional Resolution” at page 4-14.

⑧ VIRTUAL ENCODER SPEED (-3276.8 to +3276.7 mm/sec)
Set the virtual encoder speed when “VIRTUAL ENCODER” is selected in ⑧.
**AVERAGED TRAVEL TIME (0 to 3000 ms)**
At sudden change in the conveyor moving amount, the moving amounts is automatically averaged so that the manipulator moves smoothly. However, the synchronization responsiveness is lowered in this case. When the conveyor motion is not smooth, set the value to approx. “200”. When this function is not used, set at “0”.

![Graph of Averaged Travel Time](image)

**RESET SIGNAL MONITORING (0 to 65535 ms)**
Set a time to wait for the conveyor home-position input signal when no encoder reset signal for a specified conveyor has been input at the execution of SYSTART instruction. When the waiting time exceeds the set value, the SYSTART instruction is aborted and the next instruction is executed. Therefore, prepare the job so that the manipulator takes retreat motion by internal status. When “0” is set, the system waits for the conveyor home-position input signal without being interrupted by the time limit for encoder reset signal monitoring.

**CONVEYOR SPEED DOWN MODE (EXECUTE/ALARM/PAUSE JOB)**
Specify the manipulator motion when the conveyor speed is reduced lower than the conveyor lower speed limit specified in **③**.

**EXECUTE**: The manipulator is operative regardless of the conveyor speed. Accordingly, when the conveyor stops, the manipulator performs the synchronized operation with the conveyor speed 0.

![Conveyor Moving Direction](image)
ALARM: When the conveyor averaged speed is so lowered that it becomes below the set value in “CONVEYOR LOWER LIMIT SPD” of the conveyor condition file continuously for 0.1 second, an alarm occurs and the manipulator stops. This mode is used where a conveyor stop detection mechanism does not exist in the conveyor control board.

PAUSE JOB: When the conveyor speed is so lowered that it becomes below the set value in “CONVEYOR LOWER LIMIT SPD” of the conveyor condition file continuously for 0.1 second, the job motion is interrupted and the manipulator performs only the follow-up motion in the conveyor moving direction. Then, when the conveyor speed is recovered to the set value in CONVEYOR LOWER LIMIT SPD” and higher continuously for 0.1 second, the job execution restarts. In this case, only the execution of move instructions in the job are suppressed.

CONVEYOR LOWER LIMIT SPD (0 to 65535 mm/sec)

This value is used when “ALARM” or “PAUSE JOB” is selected in ⑥. When the conveyor speed becomes lower than this value, the manipulator will be in the “ALARM” mode or “PAUSE JOB” mode.
VIRTUAL ENCODER INPUT (IN#000 to IN#1024)
When the general purpose input signal of the number which is set in “VIRTUAL ENCODER INPUT” is input, the encoder input enters the virtual encoder mode.
The virtual encoder input signal is used to operate the manipulator with the conveyor stopped in the simulation of conveyor system operation.
IN#000: Not used
IN#001 to IN#1024: The set general purpose input signal is valid.

VIRTUAL ENCODER OUTPUT (OUT#000 to OUT#1024)
If “VIRTUAL ENCDR” is selected in ⑤, the output signal of the number which is set in “VIRTUAL ENCODER OUTPUT” is output.
OUT#000: Not used
OUT#001 to OUT#1024: The set signal is output.
4.2 Editing Conveyor Condition File

4.2.1 Displaying Conveyor Condition File

1. Select {ROBOT} under the top menu.
2. Select {CV CONDITION}.
3. Display a desired conveyor condition file.
   - Press PAGE key ©. The next file No. is called.
   - Press [SHIFT] + PAGE key ©. The previous file No. is called.

4.2.2 Editing Conveyor Condition File

4.2.2.1 Editing {USED STATUS}

1. Select {USED STATUS}.
2. "USED" and "NOT USED" switch alternately.

4.2.2.2 Editing {USED STATUS}

1. Select {USED STATUS}.
2. The selection dialog appears.
3. Select a desired port number.

4.2.2.3 Editing {BROKEN LINE DETECT}

1. Select {BROKEN LINE DETECT}.
2. "OFF" and "ON" switch alternately.

4.2.2.4 Editing {ENCODER INPUT}

1. Select {ENCODER INPUT}.
2. "ENCODER" and "VIRTUAL ENCDR" switch alternately.

4.2.2.5 Editing {ENCODER SIGN}

1. Select {ENCODER SIGN}.
2. "FORWARD" and "REVERSE" switch alternately.
4.2.2.6 Editing {CORRECTION}
1. Select {CORRECTION}.
2. “FORWARD” and “REVERSE” switch alternately.

4.2.2.7 Editing {TRACKING}
1. Select {TRACKING}.
2. The selection dialog appears.
3. Select a desired method.

4.2.2.8 Editing {USER COORD NO.}
1. Select {USER COORD NO.}.
2. Enter a value using the numeric keys.

4.2.2.9 Editing {BASE AXIS}
1. Select {BASE AXIS}.
   
   – Editable only if “BASE AXIS” has been selected as a tracking method.
2. The selection dialog appears.
3. Select a desired axis.

4.2.2.10 Editing {POSITIONAL RESOLUTION}
1. Select {POSITIONAL RESOLUTION}.
2. Enter a value using the numeric keys.

4.2.2.11 Editing {VIRTUAL CONVEYOR SPEED}
1. Select {VIRTUAL CONVEYOR SPEED}.
2. Enter a value using the numeric keys.

4.2.2.12 Editing {AVERAGED TRAVEL TIME}
1. Select {AVERAGED TRAVEL TIME}.
2. Enter a value using the numeric keys.

4.2.2.13 Editing {RESET SIGNAL MONITORING}
1. Select {RESET SIGNAL MONITORING}.
2. Enter a value using the numeric keys.

4.2.2.14 Editing {CONVEYOR SPEED DOWN MODE}
1. Select {CONVEYOR SPEED DOWN MODE}.
2. The selection dialog appears.
3. Select a desired mode.

4.2.2.15 Editing {CONVEYOR LOWER LIMIT SPD}
1. Select {CONVEYOR LOWER LIMIT SPD}.
2. Enter a value using the numeric keys.
4.2.2.16 Editing {VIRTUAL ENCODER INPUT}
1. Select {VIRTUAL ENCODER INPUT}.
2. Enter a value using the numeric keys.

4.2.2.17 Editing {VIRTUAL ENCODER OUTPUT}
1. Select {VIRTUAL ENCODER OUTPUT}.
2. Enter a value using the numeric keys.
4.3 Setting Conveyor Positional Resolution

The encoder mounted on the conveyor sends a pulse amount as the conveyor current position. In order that the manipulator recognizes this pulse amount as the conveyor moving amount for its synchronized motion, the pulse amount must be converted into a distance.

The conveyor moving amount (μm) per 1 pulse to be used for this conversion is called “POSITIONAL RESOLUTION”.

The conveyor positional resolution is set in units of μ. For example, when the positional resolution is 30 μ/pulse, set “30.00” in POSITIONAL RESOLUTION.

The setting range is from 0 to 999.99 μ. Since the FS100 internally quadruples every encoder pulse number, the actual conveyor positional resolution for the conveyor encoder is up to 3999.96 μ/pulse.

As the resolution error accumulates for the conveyor moving pulse amount, the setting must be made correctly. For example, setting the resolution 0.01 μ/pulse bigger causes the follow-up error of 0.1 mm at the point that the conveyor moves for 10000 pulses.

The conveyor resolution is mentioned in the specification of each conveyor, however, the value cannot be used as it is for the reasons explained below. Measure the actual conveyor resolution in the following manner.

The FS100 internally quadruples the feedback pulse from the conveyor encoder. Accordingly, the conveyor positional resolution set in the conveyor condition file is 1/4 of the conveyor resolution mentioned on your conveyor specification.
4.3.1 Setting Conveyor Positional Resolution

Set the conveyor positional resolution in the following manner.

1. Select {ROBOT} under the top menu, then select {CV MONITOR}.
   – The conveyor position window appears.

2. Take note of the current value (pulses) of the conveyor axis to be used as C1 (pulses).
   – At this moment, the conveyor should be in stop status.

3. Move the conveyor for 1 m and more to the conveyor moving direction and stop.
   – The conveyor moving amount at this moment is referred as L (m).

4. Take note of the conveyor current value (pulses) at this moment as C2 (pulses).

5. The resolution can be obtained by the formula with the measured values C1, C2 and L.

   – Formula \[ \text{Resolution} = \frac{L \times 1000000}{C2 - C1} \text{ (μ/pulse)} \]

Since the conveyor resolution influences largely the follow-up accuracy, set a value as accurate as possible.
4.3.2 Verifying and Adjusting Conveyor Positional Resolution

After the setting has been completed, verify and adjust the conveyor positional resolution in the following operations.

Prepare a job as shown below. This job is to perform a synchronized operation at execution of TIMER at P3 (3 in the below figures) on a conveyor. For teaching methods, refer to chapter 5 “Teaching” at page 5-1.

(Job Example)

0000 NOP
0001 MOVJ VJ=25.00
0002 MOVL V=300.0
0003 SYSTART CV#(1) ST=10.000
0004 SYMOVL V=200.0 CV#(1) CTP=100.000
0005 TIMER T=10.00
0006 SYMOVL V=200.0 CV#(1) CTP=100.000
0007 SYEND CV#(1)
0008 MOVJ VJ=25.00
0009 END

In the execution of this job, when the conveyor resolution value is correct, the tool center point of manipulator synchronizes the conveyor as shown in fig. 4-3 and the manipulator moves as if its tool center point is fixed on the point 3.

Fig. 4-3:
On the contrary, when the conveyor resolution value is not appropriate, the tool center point is dislocated farther from the point ③ as the follow-up time elapses as shown in fig. 4-4 and fig. 4-5, the conveyor resolution value is too big. In fig. 4-5, the conveyor resolution value is too small.

According to the resulted follow-up error, adjust the positional resolution value in the conveyor condition file and re-set if necessary.
5 Teaching

5.1 Registering Instructions

The instructions can be registered when the cursor is in the address area on the job content window in teach mode.

1. Select {JOB} under the top menu.
2. Select {JOB CONTENT}.
3. Move the cursor to the address area.

5.1.1 SYSTART Instruction

5.1.1.1 Function

This instruction indicates the start of a conveyor synchronized operation sequence. The manipulator starts follow-up motion by a move instruction after the SYSTART instruction, or TIMER or WAIT instruction.

When this instruction is executed, the manipulator stops and waits until the conveyor current position value exceeds the synchronization start position value. When it exceeds, the manipulator starts the synchronized motion.

After the instruction is executed, if the encoder reset signal is OFF and remains OFF for the time specified for “Reset signal monitoring” in the conveyor condition file, the execution of instruction is skipped and the succeeding instructions are executed. In this case, no synchronization takes place.

When the SYSTART instruction is executed, if the conveyor current position value already exceeds the synchronization start position value and the difference is within the tolerance (OL), the manipulator starts immediately from the current position the synchronized motion.

However, when the SYSTART instruction is executed, if the conveyor current position value already exceeds the synchronization start position value and the difference is greater than the tolerance (OL), execute the succeeding instructions without synchronized operation resetting the system variable $B008 to 0. The system variable $B008 is 1 when the operation has been normally completed.
5 Teaching

5.1 Registering Instructions

5.1.1.2 Format

SYSTART CV#(1) STP=50.000 OL=10.0

① Conveyor Condition File No. (CONVEYOR FILE)
Set the conveyor condition data file No. to be used.

② Synchronization Start Position (SYNC START POS)
Set the conveyor position where the synchronized operation starts.

③ Tolerance (OVER LIMIT)
Specify the maximum excess to execute the synchronized operation when the conveyor current position value exceeds the synchronization start position value at the execution of SYSTART instruction. Tolerance check will not be executed if setting is omitted or specified at 0.

5.1.1.3 Registering SYSTART Instruction

1. Move the cursor to the line just above the place where a SYSTART instruction is to be registered.

2. Press [INFORM LIST].
   - The instruction list dialog appears.

   ![Instruction List Dialog]

   The system variable $B008 can not be directly referenced. Copy to the variable Bxxx by GETS instruction and refer.

   <Example>
   
   GETS B000 $B0008
   JUMP *NG IF B000 <1

   ![Example Code]

   NOTE
   Copy to the variable Bxxx by GETS instruction and refer.
3. Select "SYSTART".
   - An instruction SYSTART is displayed in the input buffer line.

4. Change additional items.
   <Register without editing additional items>
   - Perform the operation in step 5.

   <Edit the additional items>
   - To change the conveyor condition file No. or/and the synchronization start position
     - Move the cursor to CONVEYOR FILE or SYNC START POS, and press [SELECT]. Enter a desired number or value by using the numeric keys, then press [ENTER].
   - To add, change or delete the additional item
     - Move the cursor to CONVEYOR FILE or SYNC START POS, and press [SELECT]. Move the cursor to the instruction in the input buffer line, then press [SELECT]. The detail edit window appears.
5.1.2 SYEND Instruction

5.1.2.1 Function

This instruction indicates the end of a conveyor synchronized operation sequence. The synchronized operation ends at the step where this instruction is registered.

Executing the SYEND instruction clears the conveyor home-position registered status. Then, when the conveyor home-position limit switch is ON, the conveyor home-position is updated.

Register SYEND instruction at the synchronized operation sequence end step and the head of job where the synchronized motion is performed.

5.1.2.2 Format

SYEND CV#(1)

①  Conveyor Condition File No. (CONVEYOR FILE)

Set the conveyor condition file No. to be used.

5.1.2.3 Registering SYEND Instruction

1. Move the cursor to the line just above the place where a SYEND instruction is to be registered.

2. Press [INFORM LIST].
3. Select “SYEND”.
   - An instruction SYEND is displayed in the input buffer line.

4. Press [INSERT] and [ENTER].
   - The instruction displayed in the input buffer line is registered.
5.1.3 SYMOV□ Instruction

5.1.3.1 Function

These move instructions perform the conveyor synchronized motion. Except that the conveyor position at the time of teaching is registered as CTP (conveyor teaching position), these instructions are the same as ordinary move instructions. Joint motion, linear interpolation, and circular interpolation can be performed in the same way as the ordinary move instructions. However, SYMOVJ (joint motion for conveyor synchronized operation) can be used only when the base axis is selected for synchronization. If SYMOVJ is executed when the robot axis is used for synchronization, the alarm 4583 “CAN NOT USE SMOVJ DURING TRACKING” occurs and the manipulator stops.

<table>
<thead>
<tr>
<th>SYMOVJ</th>
<th>Joint motion for conveyor synchronized operation (can be used only for synchronization by base axis).</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYMOVL</td>
<td>Linear interpolation for conveyor synchronized operation</td>
</tr>
<tr>
<td>SYMOVC</td>
<td>Circular interpolation for conveyor synchronized operation</td>
</tr>
</tbody>
</table>

When these instructions are used, the teaching method is different from that with the ordinary move instructions. Refer to chapter 5.1.4 “Interpolation Mode for Conveyor Synchronized Operation” at page 5-7.

5.1.3.2 Format

SYMOVJ  VJ=50.00  CV#(1)  CTP=100.000
SYMOVL  V=200.0  CV#(1)  CTP=100.000
SYMOVC  V=200.0  CV#(1)  CTP=100.000

1. **Play speed**
   Set the motion speed at playback.

2. **Conveyor condition file No.**
   Set the conveyor condition data file No. to be used.

3. **Conveyor position at teaching**
   Set the conveyor position for teaching.
5.1.4 Interpolation Mode for Conveyor Synchronized Operation

The interpolation mode of move instructions for conveyor synchronized operation differs from that of ordinary move instructions. Therefore, teaching is performed in “interpolation mode for conveyor synchronized operation”. Switch the interpolation mode in the following manner.

Since the conveyor positions at teaching is registered, they must be properly set up in relation to the conveyor home-position (the position where the conveyor home-position limit switch is ON).

5.1.4.1 Switching the Interpolation Mode

Pressing [SHIFT] + [MOTION TYPE] switches the interpolation mode in the input buffer line between conveyor synchronized interpolation and standard interpolation.

Press [MOTION TYPE].

The interpolation mode switches as: SYMOVJ → SYMOVL → SYMOVC.
5.2 **Motion Speed**

Generally, teaching in the direction opposite to the conveyor moving direction gives such a result as a manipulator can move more easily and slowly in playback operation.

In the conveyor synchronized operation, the manipulator motion speed is the teaching speed added the conveyor motion speed.

However, depending on the relation between the direction of manipulator motion and the conveyor moving direction, the speed is added in the different way as shown below.

**Fig. 5-1: When Teaching Direction is the Same as the Conveyor Moving Direction**

- **Manipulator motion speed**
  - When teaching: 20 m/s
  - When conveyor stops: 20 m/s

**Fig. 5-2: When Teaching Direction is Different from Conveyor Moving Direction by 90°**

- **Manipulator motion speed**
  - When teaching: 20 m/s
  - When conveyor moves: \( \sqrt{20^2 + 10^2} = 22 \) m/s

**Fig. 5-3: When Teaching Direction is Opposite to Conveyor Moving Direction**

- **Manipulator motion speed**
  - When teaching: 20 m/s
  - When conveyor moves: 10 m/s
As shown in Fig. 5-3, the manipulator motion speed when the conveyor moves is slower than that when the conveyor stops even though the teaching speed remains same. On the contrary, in case of Fig. 5-1, the manipulator motion speed when the conveyor moves is faster than that when the conveyor stops.

Therefore, teaching in the direction opposite to the conveyor moving direction is more useful for manipulator.
5.3 Wrist Posture in Synchronization

In the synchronization section, the wrist maintains its taught posture while the manipulator is synchronizing the conveyor. Teach a posture so that the wrist can be moved in the conveyor moving direction.

For example, if the wrist is taught the posture as shown in fig. 5-5, the structure of the manipulator prevents T-axis control in the conveyor moving direction. Trying to compensate this, R-axis turns sharply, possibly leading to an alarm such as segment over during the synchronized operation, which stops the manipulator.

On the contrary, if the wrist is postured as shown in fig. 5-6 in teaching, T-axis can turn to adapt to position changes in the conveyor moving direction. In this case, sufficient clearance must be provided around the wrist to allow T-axis to turn for position control.

To check whether the wrist posture is appropriate, move the user coordinate X-axis in the conveyor moving direction with the wrist held in the taught posture to confirm that any axis does not move sharply.

With a move instruction for conveyor synchronized operation, when teaching is performed so that the posture changes largely in short distance, a segment over alarm may occur. To avoid such an alarm, take the following method.

- Set the speed not as "V = " (Tool center point speed) but as "VR = " (Posture angle speed)
- Lower the speed of "V = "
5.4 Circular Interpolation Steps

Continuous circular interpolation steps should be performed on the same conveyor position.

When continuous circular interpolation steps are taught on different conveyor positions, a path different from the taught path may be resulted in the synchronized operation.

5.5 Teaching

Since the conveyor positions at teaching are registered in a job, they must be properly set up in relation to the conveyor home-position (the position where the conveyor home-position limit switch is ON).

When teaching with a workpiece, move the conveyor and turn ON the conveyor home-position limit switch by the workpiece, then move to a teaching position. When the conveyor home-position limit switch is turned ON, the position where the switch is turned ON is registered automatically as the conveyor home-position.

1. Conveyor home-position limit switch
   - Conveyor moves

2. Conveyor home-position limit switch turns ON.
   - Conveyor position is reset to 0 mm.
1. Select {ROBOT} under the top menu.
2. Select {CV MONITOR}.

- The CONVEYOR POSITION window appears.

Perform teaching after having confirmed that the conveyor is completely stopped. Teaching while the conveyor moves may cause an error or segment over alarm.
3. Move the conveyor.
   - Move the conveyor, and after the conveyor home-position limit switch is ON, stop the workpiece at the teaching position.
   At the moment the conveyor home-position limit switch is ON, “CURR POS (PULSE)” in the conveyor position window is reset to “0”, which confirms that the counter is reset.

4. Display JOB CONTENT window

5. Press [SHIFT] + [MOTION TYPE].
   - The motion type is set to the conveyor synchronized interpolation mode.

6. Select a motion type
   - Select a motion type to be used by pressing [MOTION TYPE].

7. Press an axis key.
   - Move the manipulator to a desired position by using axis keys.

8. Press [ENTER].
   - The step is registered.

<Example>

When teaching is performed at the position 1000 mm from the conveyor home-position in linear interpolation, using the conveyor condition file No. 1, it will be registered as follows.

```
1000 SYMOV1 V=100.0 CVR(1) CTP=1000.000
```

The registration after the above is the same as that for an ordinary teaching.

When a move instruction for conveyor synchronized operation is used again after the motion type mode is changed to other than conveyor synchronized interpolation mode in a teaching for air-cut and so on, the conveyor synchronized interpolation mode must be re-selected.
5.6 Teaching After Interruption of Playback in Synchronized Operation

When the synchronized operation is interrupted by hold operation or switching to teach mode and so on during playback in synchronized operation, if another conveyor home-position is attempted to be registered, a conveyor home-position input signal is not accepted. At this moment, the tracking status in the conveyor tracking window is “ON” (marked with ●).

The operations in the following two cases are explained:

- When adding or changing step after interruption of synchronized operation.
- When performing another teaching (for other workpiece).

5.6.1 When Adding or Changing Step After Interruption of Synchronized Operation

In the state that the synchronized operation in play mode is interrupted, a step can be added or changed. Confirm the step position by FWD operation, then add or change.
5 Teaching
5.6 Teaching After Interruption of Playback in Synchronized Operation

- Confirm by FWD operation, and add or change the step.

SYMOVL V=1000 CV(1) CTP=200.000
5.6.2 When Performing Another Teaching (for Other Workpiece)

1. Reset the synchronized operation status by executing an instruction SYEND or shutting down the control power supply.

2. Confirm that TRACKING STATUS in the conveyor tracking status window is OFF (marked with O).

3. Move the conveyor, and turn ON the conveyor home-position limit switch by the workpiece.

4. Move the manipulator to the teaching point and teach.

- Conveyor synchronized operation interrupted.
- Switched to teach mode.
- Manipulator stops; the conveyor also stops.

- Execute SYEND instruction.
5.7 Notes on Operation

The conveyor synchronized move instructions are special instructions for registering a conveyor position together with a manipulator position. Therefore, different from ordinary move instructions such as MOVJ, these instructions have the following restrictions on operations.

5.7.1 Confirming Reach to Step

When the manipulator reaches the target step in FWD/BWD operation or test run (step motion mode) by a conveyor synchronized move instruction, the operation is stopped and the cursor stops blinking. In this way, it can be easily confirmed that the manipulator reaches the target step.

NOTE

When the manipulator reaches the target step, the cursor stops blinking, however, the cursor restarts blinking when the following operations are performed. In this case, move the cursor to the target step and perform FWD operation again.

- Emergency stop
- The cursor is moved in editing job
- File and job editing operation
- Jog operation

5.7.2 Backward (BWD) Operation

Releasing [FWD] and pressing [BWD] in middle of FWD operation does not return the manipulator to the previous step, but the manipulator continues the FWD operation to the next step. Pressing [BWD] after the manipulator reaches the next step, returns the manipulator to the previous step.

5.7.3 Changing Tool

The FWD operation of the first SYMOV□ instruction after changing a tool, should be performed on the conveyor position at changing a tool.

Performing the FWD operation after changing a tool and moving the conveyor causes a segment over alarm.

5.7.4 Deleting Taught Points

Before deleting a move instruction, the manipulator must be placed at the step position to be deleted. However, this condition can not be satisfied with conveyor synchronized move instructions. This is because a taught position for a conveyor synchronized move instruction is interpreted to different step positions on the conveyor position, as explained before. Therefore, ordinary deleting operation is not possible.

To delete a conveyor synchronized move instruction, press [MODIFY] to change the step position. Then, after the cursor blinks, press [DELETE].
## 5.8 Job Example

A basic job example is shown below.

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOP</td>
<td></td>
</tr>
<tr>
<td>SYEND CV#(1)</td>
<td>Resets the conveyor home-position registered status. After then, a conveyor home-position limit switch signal is accepted.</td>
</tr>
<tr>
<td>MOVJ</td>
<td>After the job is started, the manipulator moves to its stand-by position.</td>
</tr>
<tr>
<td>SYSTART CV#(1) STP=100.000</td>
<td>Conveyor synchronization start instruction. If the conveyor reaches the specified position (ex.: 100 mm), the conveyor synchronization starts.</td>
</tr>
<tr>
<td>GETS B000 $B008</td>
<td>Converts system variable $B008, which indicated whether the synchronized operation starts normally or not, to B000. Normal if B000 = 1, abnormal if B000 = 0.</td>
</tr>
<tr>
<td>JUMP *END IF B000=0</td>
<td>If B000 is 0 (synchronized operation could not start due to an error), jump to the label <strong>END</strong>.</td>
</tr>
<tr>
<td>SYMOVL CV#(1) CTP=50.000</td>
<td>Conveyor synchronized move instruction. Moves in conveyor synchronized status.</td>
</tr>
<tr>
<td>SYMOVL CV#(1) CTP=50.000</td>
<td></td>
</tr>
<tr>
<td>*END</td>
<td>Jump destination in case of failure in normal starting of conveyor synchronized operation</td>
</tr>
<tr>
<td>SYEND CV#(1)</td>
<td>Ends the conveyor synchronized operation.</td>
</tr>
<tr>
<td>MOVJ END</td>
<td>The manipulator returns to the stand-by position. End.</td>
</tr>
</tbody>
</table>
6 Playback

6.1 Conveyor Speed Down

When the conveyor slows down while the manipulator is synchronizing the conveyor, the manipulator will react according to the mode setting in the conveyor condition data file:

<table>
<thead>
<tr>
<th>CY SPEED DOWN MODE</th>
<th>EXECUTE</th>
</tr>
</thead>
<tbody>
<tr>
<td>CY LATER LIMIT SPEED</td>
<td>50 cm/sec</td>
</tr>
</tbody>
</table>

Conveyor Condition File Window

- **EXECUTE**
  Regardless of the conveyor speed, the manipulator continues its operation.

- **ALARM**
  An alarm occurs when the conveyor speed slows down.

- **PAUSE JOB**
  The manipulator stops the job operation but only continues follow-up motion when the conveyor speed slows down.

For details of these three modes, refer to "CONVEYOR SPEED DOWN MODE (EXECUTE/ALARM/PAUSE JOB)" explained in chapter 4.1 "Conveyor Condition File" at page 4-1.
6.2 Accuracy

The conveyor synchronized operation function reproduces the path taught with the conveyor in stop status.

Therefore, the accuracy of conveyor synchronized operation function is determined by the amount of difference between the taught path and the synchronized path. Since the object is moving, it is impossible to appreciate the accuracy in the same way as the repetitive positioning accuracy for the still-object.

The amount of difference between the taught path and the synchronized path is resulted from the following factors in interaction. Even if the following factors are adjusted not to cause the difference, the difference shows about ten times the difference from repetitive positioning for still-object.

- Linearity of the conveyor in the synchronization section.
- Conveyor movements that are not indicated in motion pulse data from a conveyor encoder (such as swings with a hanger conveyor).
- Differences between the manipulator actual dimensions and the dimensions registered in FS100.
- Conversion resolution error that occurs when converting the conveyor motion pulse (number of pulses) from the conveyor encoder to the conveyor moving amount (mm). The details of conversion resolution error will be explained in chapter 6.3 "Conveyor Resolution Error".
- Manipulator mechanical accuracy such as arm bending.
- Follow-up delay for the conveyor speed fluctuation.
- Manipulator system lag time.
- Difference between the conveyor moving direction and the traveling axis moving direction when the synchronization is performed by the traveling axis.

6.3 Conveyor Resolution Error

The synchronization error resulted from the conveyor resolution setting error increases as the conveyor position value increases. The farther the conveyor moves, the bigger the synchronization error becomes. The minimum value for conveyor positional resolution setting is 0.01 μm. Therefore, a maximum error of 0.005 μm per pulse may occur.

For example, when the conveyor resolution is 10 μm and the synchronization distance is 2 m, 200000 pulses are output while the conveyor moves for 2 m. Since the maximum error per pulse is 0.005 μm, the synchronization error would be: 200000 pulses × 0.005 μm = 1 mm.
6.4 Restarting Synchronization After Manipulator Stops

When a manipulator stops during the conveyor synchronized operation in the following cases, the synchronized operation is restarted by restarting the manipulator:

- Minor failure alarm (excluding occurrence of alarm related to the conveyor synchronized function)
- Emergency stop or external emergency stop
- Hold or external hold
- Switch of the mode (mode switching between play and teach mode)
- Switch of the operation cycle (switching among auto/1 cycle/step)

6.5 Continuance of Conveyor Synchronized Status

The conveyor synchronized status started by execution of SYSTART instruction remains until SYEND instruction is executed or the control power supply is turned OFF. Even if a manipulator stops in the cases explained in the previous section, the conveyor synchronized status remains.

Note that the synchronized operation is performed by execution of SYMOV□ instruction even if the cursor is moved in teach mode, the master job is called or a job selection is made.

6.6 Continuance of Parallel Shift Status

The parallel shift status in the conveyor synchronized status continues even after a manipulator stops in the cases explained in the previous section. However, the parallel shift status is cleared in the following cases. Be careful when using the parallel shift function in combination with the conveyor synchronized function.

- Execution of SFTOF instruction
- The cursor is moved in teach mode
- The master job is called
- Job selection
- The main power supply is shut down.

6.7 Conveyor Synchronized Operation During Execution of TIMER and WAIT

While the manipulator is in waiting status by execution of TIMER, WAIT, and so forth, the conveyor synchronized operation continues.
7 Conveyor Monitoring Windows

There are three windows for conveyor monitoring as follows:

- Conveyor position window.
- Conveyor speed window.
- Conveyor tracking status window.

Call each window in the following manner.

1. Select {ROBOT} under the top menu.
2. Select {CV MONITOR}.
3. Display the conveyor position window.
4. Display a desired window.

- PAGE key switches from one window to another in the following order:

  CONVEYOR POSITION window → CONVEYOR SPEED window → CV TRACKING STATUS window.

Press [SHIFT] + PAGE key to return to the previous window.
7.1 Conveyor Position Window

1. **Conveyor Condition File No.**
   CV#1 to CV#6 are displayed.

2. **CURR POS (PULSE)**
   The number of feedback pulses from the encoder connected to the conveyor calculated on the base of the position where the conveyor home-position limit switch turns ON as “0”. Used for setting of conveyor resolution.

3. **CURR POS (mm)**
   The value converted from the number of pulses of current position into the distance from the position where the conveyor home-position limit switch turns ON by using the resolution. When the resolution is not set, “0” is displayed.
7.2 Conveyor Speed Window

1. **Conveyor Condition File No.**
   CV#1 to CV#6 are displayed.

2. **SPEED (mm/sec)**
   Conveyor averaged speed per 0.1 sec.

3. **CORRECT POS (mm)**
   The manipulator follows up the conveyor with a certain delay time to the input conveyor position. Therefore, performing the follow-up motion according to the conveyor current position causes a follow-up error. With the FS100, the follow-up motion is performed according to the conveyor position compensated for the follow-up error. This compensated conveyor position is displayed here.
7 Conveyor Monitoring Windows

7.3 Conveyor Tracking Status Window

1. **Conveyor Home-Position Input Signal No.**
   The conveyor home-position input signal No. LS#1 and LS#2 are the input signals connected to CN1 and CN2 respectively. And LS#3 is connected to CN3 of the 2nd conveyor board respectively.

2. **INPUT STATUS**
   Indicates each conveyor home-position input status.
   “O” is indicated during the normal condition.
   “●” is indicated only a moment when the conveyor home-position input signal turns ON and this signal rise is detected.

   **NOTE**
   Even the conveyor home position input signal is already turned ON, the input status once changes to “●” upon detection of the rise of signal, then it returns to “O”.

3. **Conveyor Condition File No.**
   CV#1 to CV#6 are displayed.

4. **TRACKING STATUS**
   Indicates the manipulator synchronizing status.
   ●: Indicated when the manipulator is in synchronized operation status after the synchronized operation starts by execution of SYSTART instruction or after SYMOV instruction is executed in FWD operation.

   As long as “●” is indicated, the conveyor home-position input signal is not accepted and the synchronized status remains until the execution of SYEND instruction or the control power supply is shut down.

   O: Indicated when the manipulator synchronizing status is cancelled.
8 Virtual Encoder Mode

8.1 Virtual Encoder Pulse Count

When the manipulator is stopped during operation with a virtual encoder, the virtual encoder pulse counting is stopped as well as the manipulator. Since the virtual encoder continues counting pulses by restarting the manipulator, the manipulator can be restarted from the position where it stopped.

8.2 Relation Between Encoder Input and Virtual Encoder Input

There are two types of settings for encoder input:

- Setting by “ENCODER INPUT” in the conveyor condition file.
- Setting by “VIRTUAL ENCODER INPUT” in the conveyor condition file.

The relation between “ENCORDER INPUT” setting and the virtual encoder by “general purpose input signal” setting is as follows:

- When the “ENCORDER INPUT” = “VIRTUAL ENCORDER”
  Regardless of the status of general purpose input signal, the manipulator operates with the virtual encoder pulse.
- When the “ENCORDER INPUT” = “ENCORDER”
  When the general input signal is ON, the manipulator operates with the virtual encoder pulse.
  When the general input signal is OFF, the manipulator operates with the encoder input.

8.3 Precaution on Switching the Encoder Mode

Switching the mode “Encoder/Virtual Encoder” by the general purpose input signal during the conveyor synchronized operation causes the alarm “CANNOT CHANGE CONVEYOR MODE”.

Be sure to switch the encoder mode by the general purpose input signal while the manipulator is not in the conveyor synchronized operation.
9 Turntable Synchronized Function

Functional Overview

This function enables interpolation motion of the manipulator, synchronized with circular conveyor and turntable.

9.1 Setting Up the Turntable Synchronized System

9.1.1 Settings for Conveyor Condition File

To use this function, set the TRACKING (1) in CONVEYOR COND FILE window to "CIRCULAR". (Use a Cursor to scroll the window.)

1 TRACKING (ROBOT-AXIS/BASE-AXIS/CIRCULAR)

CIRCULAR: specify CIRCULAR for turntable synchronized function. If CIRCULAR is specified, the manipulator performs a circular tracking operation in accordance with a result of calibration executed in chapter 9.1.2 “Calibration between Manipulator and Turntable” at page 9-2.

2 USER COORD NO. (1 to 16)

Specify the user coordinate number to store the result of calibration (relative position of the turntable).

3 POS RESOLUTION (1 to 2147483647 pulse/rev)

Set a pulse count from encoder per turntable revolution. If the turntable positional resolution is unknown, use the data calculated in the calibration.

4 VIRTUAL CV SPEED (-32767 to +32767 pulse/sec)

5 CV LOWER LIMIT SPEED (0 to 65535 pulse/sec)

Input unit changes to "mm/sec" to "p/sec" by setting the tracking method (item 1) to CIRCULAR.
9.1.2 Calibration between Manipulator and Turntable

The manipulator-turntable calibration is a setting required before carrying out a synchronized operation of manipulator and turntable. Before the synchronized operation, register their positional correlation following the procedures explained in this section.

9.1.2.1 Setting a Calibration Tool

1. Equip the manipulator with a calibration tool.
   - Use a tool of which accurate dimensions are given.

2. Select {ROBOT} under the top menu.
3. Select {TOOL}.
   - The TOOL window appears.

4. Input the tool measurement.
5. Press [ENTER].
9.1.2.2 Teaching Calibration Position

1. Define a desired point (P-point) on turntable. Adjust the manipulator control point to the P-point, and register C1.

2. Rotate the turntable to desirable extent. (Make sure to rotate it in direction of normal rotation.) Adjust the manipulator control point to the rotated P-point, and register C2.

3. Rotate the turntable in the same direction as the previous step. Adjust the manipulator control point to the rotated P-point, and register C3.

9.1.2.3 Operating Calibration

1. Select {ROBOT} under the top menu.
2. Select {CONVEYOR CALIBRATION}.
3. Click on {PAGE} to select a desired conveyor condition file. Press [ENTER] after deciding the file number.

(Note that this process can be achieved by pressing PAGE key.)

4. Move the cursor to "**" to select a manipulator.
   (Note that the asterisk indicates that there is more than one manipulator: skip this process if there is only one manipulator to control.)
   – Select a manipulator from a drop-down listbox.

5. Select {SET POS}.

6. Turn ON the home position limit switch by moving the turntable.

7. Move the manipulator to the calibration position with axis keys.

8. Press [MODIFY], then [ENTER].
   – The taught position will be displayed on the window.
9. Select {COMPLETE}.

- The calibration position is registered.
- The taught coordinates are registered in the user coordinate number which is specified in the conveyor condition file. The registered data can be modified by inputting numbers.

- The turntable positional resolution will be calculated when the calibration is carried out.
- If the turntable positional resolution has not been given, set the calculated resolution in the conveyor condition file.
9.2 Modifying Instructions

In case of using the turntable synchronized function, the units used for distance and speed are changed from mm (μ) to pulse. The instructions are modified accordingly as follows:

• SYSTART Instruction

[Linear Conveyor Synchronization]
SYSTART CV (#1) STP=50.000 OL=10.0

[Turntable Synchronization]
SYSTART CV (#1) STPP=5000 OLP=100

① Synchronization start position in pulse
Set the conveyor position where the synchronized operation starts in pulse.

② Tolerance
Specify the maximum excess in pulse to execute the synchronized operation when the conveyor current position value exceeds the synchronization start position value at the execution of SYSTART instruction. Tolerance check will not be executed if setting is omitted or specified at 0.

• SYMOV□ Instruction

[Linear Conveyor Synchronization]
SYMOVL V=200.0CV (#1) CTP=100.000
SYMOVC V=200.0CV (#1) CTP=100.000

[Turntable Synchronization]
SYMOVL V=200.0CV (#1) CTPP=100.000
SYMOVL V=200.0CV (#1) CTPP=100,000

① Conveyor position at teaching
Set the conveyor position for teaching in pulse.
Manual Conveyor Function is a manual setting function for conveyor position. This function enables the conveyor position to be set from the programming pendant without moving the conveyor to modify the taught job.

With this function, instead of moving the conveyor to move the workpiece to the teaching position, by removing a fastening device such as a dog and moving the workpiece to the desired position on the conveyor, the conveyor position can be input to modify the taught job. When the taught job is modified by using the Manual Conveyor Function, the newly set value of the conveyor position is registered to the value of CTP when the registration of the move instruction for the synchronized motion (SYMOV□) is modified.

1. Select {ROBOT} under the top menu.
2. Select {MANUAL CONVEYOR}.
   - The MANUAL CONVEYOR window appears.

1. **Conveyor Condition File No.**
   Displays CV#1 to 6.

2. **CURRENT (mm)**
   Indicates the conveyor's current position (in actual amount of pulses). When the Manual Conveyor Function is used, the position data set is displayed.

3. **SET (mm) (0 to 21000 mm)**
   Sets the conveyor position. A value out of the setting range cannot be entered.

4. **SET**
   Enables or disables the manual setting mode for the conveyor position.
10.1 Settings for Manual Conveyor Function

10.1.1 Setting the Conveyor Position

1. Move the cursor to the desired value in the column of the {SET (mm)}
2. Enter a value using the numeric keys.

10.1.2 Enabling/Disabling the Setting

1. Move the cursor to the desired value in the column of the {SET}.
2. Press [SELECT].
   – “VALID” and “INVALID” switch alternately.

10.2 Precautions

10.2.1 When the Power is Turned ON

When the power is turned ON, all the setting for the Manual Conveyor Function are disabled regardless of the play or teach mode, and the actual conveyor positions are indicated in {CURRENT (mm)}.

When the MANUAL CONVEYOR window is called up after the power is turned ON, “***” appears in the column of {SET (mm)}. The set conveyor positions are retained until the power is turned OFF.

- When the teach mode is switched to the play mode while the Manual Conveyor Function is enabled, the function is automatically disabled.
- The MANUAL CONVEYOR window can be viewed only in the teach mode.
- The Manual Conveyor Function is enabled only when the turntable synchronized function is disabled.
11 Manual Setting Function for Conveyor Home-Position Limit Switch

When the conveyor home-position limit switch cannot be turned ON, it can be pseudonymously turned ON in the following manner:

1. Open the CV TRACKING STATUS window.

![CV TRACKING STATUS Window]

① **LS#**
Indicates the conveyor home-position input signal number.

② **INPUT STATUS**
Indicates the conveyor home-position input signal status, or inputs the conveyor home-position input signal.

2. Move the cursor to the limit switch number connected to the conveyor home-position input signal that is set in PORT NO. in the conveyor condition file.

3. By pressing [INTERLOCK] and [SELECT] at the same time, select “ON” status to pseudonymously turn the conveyor home-position input signal ON.

“●” is indicated at INPUT STATUS while the key is pressed and it returns to “○” when the key is released.

---

**NOTE**

"Manual setting function for conveyor home-position limit switch" is valid only when the encoder input is set to “VIRTUAL ENCODER INPUT” in the conveyor condition file.

And this function is operable in the teach mode only.

When "ENCORDER INPUT" is set in the conveyor condition file or when the mode teach mode, the signal would not be input.
12 Instruction List
