YRC1000micro
INSTRUCTIONS

Upon receipt of the product and prior to initial operation, read these instructions thoroughly, and retain for future reference.

MOTOMAN INSTRUCTIONS

Please have the following information available when contacting Yaskawa Customer Support:

- System
- Primary Application
- Software Version (Located on Programming Pendant by selecting: {Main Menu} - {System Info} - {Version})
- Robot Serial Number (Located on robot data plate)
- Robot Sales Order Number (Located on controller data plate)

Part Number: 181274-1CD
Revision: 3
DANGER

- This manual describes setup, diagnosis, maintenance, hardware, etc. of the YRC1000micro system. Read this manual carefully and be sure to understand its contents before handling the YRC1000micro. Any matter, including operation, usage, measures, and an item to use, not described in this manual must be regarded as “prohibited” or “improper”.

- General information related to safety are described in “Chapter 1. Safety” of “YRC1000micro INSTRUCTIONS”. To ensure correct and safe operation, carefully read “Chapter 1. Safety” of “YRC1000micro INSTRUCTIONS”.

CAUTION

- In some drawings in this manual, protective covers or shields are removed to show details. Make sure that all the covers or shields are installed in place before operating this product.

- YASKAWA is not responsible for incidents arising from unauthorized modification of its products. Unauthorized modification voids the product warranty.

NOTICE

- The drawings and photos in this manual are representative examples and differences may exist between them and the delivered product.

- YASKAWA may modify this model without notice when necessary due to product improvements, modifications, or changes in specifications. If such modification is made, the manual number will also be revised.

- If your copy of the manual is damaged or lost, contact a YASKAWA representative to order a new copy. The representatives are listed on the back cover. Be sure to tell the representative the manual number listed on the front cover.
Read this manual carefully before installation, operation, maintenance, or inspection of the YRC1000micro.

In this manual, the Notes for Safe Operation are classified as “DANGER”, “WARNING”, “CAUTION”, or “NOTICE”.

**DANGER**

Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury. Safety Signs identified by the signal word DANGER should be used sparingly and only for those situations presenting the most serious hazards.

**WARNING**

Indicates a potentially hazardous situation which, if not avoided, will result in death or serious injury. Hazards identified by the signal word WARNING present a lesser degree of risk of injury or death than those identified by the signal word DANGER.

**CAUTION**

Indicates a hazardous situation, which if not avoided, could result in minor or moderate injury. It may also be used without the safety alert symbol as an alternative to “NOTICE”.

**NOTICE**

NOTICE is the preferred signal word to address practices not related to personal injury. The safety alert symbol should not be used with this signal word. As an alternative to “NOTICE”, the word “CAUTION” without the safety alert symbol may be used to indicate a message not related to personal injury.

Even items described as “CAUTION” may result in a serious accident in some situations.

At any rate, be sure to follow these important items.

**NOTE**

To ensure safe and efficient operation at all times, be sure to follow all instructions, even if not designated as “DANGER”, “WARNING” and “CAUTION”.
DANGER

• Before operating the manipulator, make sure the servo power is turned OFF by performing the following operations. When the servo power is turned OFF, the SERVO ON LED on the programming pendant is turned OFF.
  – Press the emergency stop button on the programming pendant or on the external control device, etc.
  – Disconnect the safety plug of the safety fence.
(when in the play mode or in the remote mode)
If operation of the manipulator cannot be stopped in an emergency, personal injury and/or equipment damage may result.

Fig. : Emergency Stop Button

• Before releasing the emergency stop, make sure to remove the obstacle or error caused the emergency stop, if any, and then turn the servo power ON.
Failure to observe this instruction may cause unintended movement of the manipulator, which may result in personal injury.

Fig. : Release of Emergency Stop

• Observe the following precautions when performing a teaching operation within the manipulator's operating range:
  – Be sure to perform lockout by putting a lockout device on the safety fence when going into the area enclosed by the safety fence. In addition, the operator of the teaching operation must display the sign that the operation is being performed so that no other person closes the safety fence.
  – View the manipulator from the front whenever possible.
  – Always follow the predetermined operating procedure.
  – Always keep in mind emergency response measures against the manipulator’s unexpected movement toward a person.
  – Ensure a safe place to retreat in case of emergency.
Failure to observe this instruction may cause improper or unintended movement of the manipulator, which may result in personal injury.

• Confirm that no person is present in the manipulator's operating range and that the operator is in a safe location before:
  – Turning ON the YRC1000micro power
  – Moving the manipulator by using the programming pendant
  – Running the system in the check mode
  – Performing automatic operations
Personal injury may result if a person enters the manipulator's operating range during operation. Immediately press an emergency stop button whenever there is a problem. The emergency stop button is located on the upper right right of the programming pendant.

• Read and understand the Explanation of the Warning Labels before operating the manipulator.
**DANGER**

- In the case of not using the programming pendant, be sure to supply the emergency stop button on the equipment. Then before operating the manipulator, check to be sure that the servo power is turned OFF by pressing the emergency stop button. Connect the external emergency stop button to the 4-14 pin and 5-15 pin of the Safety connector (Safety).
- Upon shipment of the YRC1000micro, this signal is connected by a jumper cable in the dummy connector. To use the signal, make sure to supply a new connector, and then input it.

If the signal is input with the jumper cable connected, it does not function, which may result in personal injury or equipment damage.

**WARNING**

- Perform the following inspection procedures prior to conducting manipulator teaching. If there is any problem, immediately take necessary steps to solve it, such as maintenance and repair.
  - Check for a problem in manipulator movement.
  - Check for damage to insulation and sheathing of external wires.
- Return the programming pendant to a safe place after use.

If the programming pendant is left unattended on the manipulator, on a fixture, or on the floor, etc., the Enable Switch may be activated due to surface irregularities of where it is left, and the servo power may be turned ON. In addition, in case the operation of the manipulator starts, the manipulator or the tool may hit the programming pendant left unattended, which may result in personal injury and/or equipment damage.
Definition of Terms Used Often in This Manual

The MOTOMAN is the YASKAWA industrial robot product.

The MOTOMAN usually consists of the manipulator, the YRC1000micro controller, manipulator cables, the YRC1000micro programming pendant (optional), and the YRC1000micro programming pendant dummy connector (optional).

In this manual, the equipment is designated as follows:

<table>
<thead>
<tr>
<th>Equipment</th>
<th>Manual Designation</th>
</tr>
</thead>
<tbody>
<tr>
<td>YRC1000micro controller</td>
<td>YRC1000micro</td>
</tr>
<tr>
<td>YRC1000micro programming pendant</td>
<td>Programming pendant (optional)</td>
</tr>
<tr>
<td>Cable between the manipulator and the controller</td>
<td>Manipulator cable</td>
</tr>
<tr>
<td>YRC1000micro programming pendant dummy connector</td>
<td>Programming pendant dummy connector (optional)</td>
</tr>
</tbody>
</table>
Descriptions of the programming pendant keys, buttons, and displays are shown as follows:

<table>
<thead>
<tr>
<th>Equipment</th>
<th>Manual Designation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Programming Pendant</td>
<td>Character Keys /Symbol Keys: The keys which have characters or symbols printed on them are denoted with [] e.g. [ENTER]</td>
</tr>
<tr>
<td>Axis Keys /Numeric Keys</td>
<td>[Axis Key] and [Numeric Key] are generic names for the keys for axis operation and number input.</td>
</tr>
<tr>
<td>Keys pressed simultaneously</td>
<td>When two keys are to be pressed simultaneously, the keys are shown with a “+” sign between them, e.g. [SHIFT]+[COORD].</td>
</tr>
<tr>
<td>Mode Switch</td>
<td>Mode Switch can select three kinds of modes that are denoted as follows: REMOTE, PLAY or TEACH. (The switch names are denoted as symbols)</td>
</tr>
<tr>
<td>Button</td>
<td>The three buttons on the upper side of the programming pendant are denoted as follows: START, HOLD, or EMERGENCY STOP. (The button names are denoted as symbols)</td>
</tr>
<tr>
<td>Displays</td>
<td>The menu displayed in the programming pendant is denoted with {}. e.g. {JOB}</td>
</tr>
</tbody>
</table>

*The button/switch names are denoted as symbols.*
Description of the Operation Procedure

In the explanation of the operation procedure, the expression "Select • • • " means that the cursor is moved to the object item and [SELECT] is pressed, or that the item is directly selected by touching the screen.

Registered Trademark

In this manual, names of companies, corporations, or products are trademarks, registered trademarks, or brand names for each company or corporation. The indications of (R) and TM are omitted.
Explanation of Warning Labels

The following warning labels are attached to the manipulator and YRC1000micro.

Fully comply with the precautions on the warning labels.

- The label described below is attached to the manipulator.
Observe the precautions on the warning labels.
Failure to observe this caution may result in injury or damage to equipment.
Refer to the manipulator manual for the warning label location.

- The following warning labels are attached to YRC1000micro.
Observe the precautions on the warning labels.
Failure to observe this warning may result in injury or damage to equipment.

---

**DANGER**

- The label described below is attached to the manipulator.

---

**WARNING**

- The following warning labels are attached to YRC1000micro.

---

1 Safety

1.1 For Your Safety

Robots generally have requirements which are different from other manufacturing equipment, such as larger working areas, high-speed operation, rapid arm movements, etc., which can pose safety hazards. Read and understand the instruction manuals and related documents, and observe all precautions in order to avoid the risk of injury to personnel and damage to equipment.

It is the user’s responsibility to ensure that all local, state, and national codes, regulations rules, or laws relating to safety and safe operating conditions are met and followed.

---

**DANGER**

- Teaching operation and maintenance operation of the robot must conform to:
  - Industrial Safety and Health Law
  - Order for Enforcement of the Industrial Safety and Health Law
  - Industrial Safety and Health Regulations
  - Technical Standards for Electrical Facilities

Other related laws and regulations are:
- Occupational Safety and Health Act in USA
- Factory Act (Gewerbeordnung) in Germany
- Health and Safety at Work, etc. Act in UK
- EC Machinery Directive 2006/42/EC

- Prepare
  - SAFETY WORK REGULATIONS based on concrete policies for safety management complying with related laws and regulations.

- Observe
  - JIS B 8433-1; 2015 “Robots for industrial environments-Safety requirements” (ISO 10218-1: 2011) for safe operation of the robot. (JIS B 8433 is for Japan only)

- Reinforce the
  - SAFETY MANAGEMENT SYSTEM by designating authorized operators and safety managers for the robot, as well as giving continuing safety education and training.

- Teaching operation and maintenance operation of the robot are specified as “Hazardous Operations” in the Industrial Safety and Health Act (for Japan only).

Personnel engaged in these operations must receive special training offered by YASKAWA.
1.2 Special Training

DANGER

• Personnel engaged in operation, maintenance, or management of the robot must receive required training before using the robot.
• For more information on training, contact your YASKAWA representative. The telephone numbers of our offices are listed on the back cover of this manual.

1.3 MOTOMAN Manual List

DANGER

• For safety, make sure to have the following manuals for MOTOMAN on hand, read them thoroughly and understand the contents of them:
  – MOTOMAN-□□□ INSTRUCTIONS
  – YRC1000micro INSTRUCTIONS
  – YRC1000micro MAINTENANCE MANUAL
  – YRC1000micro OPERATOR’S MANUAL
  – YRC1000micro ALARM CODES (MAJOR ALARMS) (MINOR ALARMS)
• Confirm that you have all the above manuals on hand. If any of them is missing, contact your YASKAWA representative. The telephone numbers of our offices are listed on the back cover of this manual.
1.4 Personnel Safety

The entire manipulator P-point maximum envelope is potentially dangerous.

All personnel working with the MOTOMAN (safety administration, installation, operation, and maintenance personnel) must always be prepared and "Safety First" minded, to ensure the safety of all personnel.

**WARNING**

- In the vicinity of the area where the MOTOMAN is installed, avoid any dangerous actions, such as entering the manipulator's operating range without due care.

  Failure to observe this instruction may cause contact with the manipulator or peripheral equipment, which may result in personal injury.

- Strictly observe the safety precautions and signs in the factory, such as "Flammable", "High Voltage", "Danger", "Off-limits to Unauthorized Personnel".

  Failure to observe this instruction may result in fire, electric shock, and/or personal injury caused by contact with the manipulator or other equipment.

- Strictly observe the following precautions about clothing:
  - Always wear approved work clothes (no loose-fitting clothes).
  - To prevent misoperation, do not wear gloves when operating the MOTOMAN.
  - Do not let the underwear, shirts, or neckties hang out from the work clothes.
  - Do not wear large accessories, such as earrings, rings, or necklaces.
  - Always wear protective safety equipment, such as hard hats, safety shoes (with slip-proof soles), face shields, safety glasses, and gloves as necessary.

  Failure to observe this instruction may result in personal injury.

- The following must be understood and strictly observed by all personnel as rules:
  - Unauthorized personnel other than the operator must not approach the area where the MOTOMAN is installed.
  - Do not let unauthorized personnel other than the operator approach the area where the MOTOMAN is installed.

  Failure to observe this instruction may cause contact with the manipulator, the YRC1000micro, the control panel, the workpiece, or the positioner, etc., which may result in personal injury.
1 Safety
1.4 Personnel Safety

**WARNING**

- Do not forcibly move an axis of the manipulator. Do not hang from or get on the manipulator.
  Failure to observe this instruction may result in personal injury and/or equipment damage.

- Do not sit or lean on the YRC1000 micro.
  Failure to observe this instruction may result in personal injury and/or equipment damage.

- Do not turn a switch or press a button, etc. on the YRC1000 micro or other control panels without due care.
  Failure to observe this instruction may cause unexpected movement of the manipulator, which may result in personal injury and/or equipment damage.

- Do not let unauthorized personnel touch the YRC1000 micro or the programming pendant while the power is ON.
  Failure to observe this instruction may cause unexpected movement of the manipulator, which may result in personal injury and/or equipment damage.
1.5 MOTOMAN Safety

The followings are safety functions of MOTOMAN/YRC1000micro.

- Emergency stop SW input (programming pendant)
- Enable SW input (programming pendant)
- Safeguarding interlock signal input (safety plug)
- External emergency stop SW input
- Protected stop signal input
- Overrun input (manipulator/external axis)
- General-purpose safety input (Enabled when the option board (JANCD-ASF32-E) is connected.)
- Safety logic circuit

These safety functions conform to the following safety standards.

- EN ISO 13849-1: 2015 Cat.3/PLe
- EN 62061 (IEC 61508) SIL CL3

The use frequency of each switch for safety functions is assumed as below.

- Emergency stop SW: 500 times/year
- Enable SW (programming pendant): 2000 times/year
1.5.1 Installation and Wiring Safety

In planning installation, adapt an easy to observe arrangement to ensure safety. Take safety into consideration when planning the installation. Observe the following when installing the manipulator:

**WARNING**

- As the installation site for the manipulator, select an area such as the following:
  - Confirm that the area is large enough so that the fully-extended manipulator arm with the tool will not reach the wall, the safety fence, the YRC1000micro, etc.

Failure to observe this instruction may cause contact with the manipulator, which may result in personal injury and/or equipment damage.

- Make sure that the maximum operating range of the manipulator including the ends of the tool and the workpiece can be clearly recognized by lines marked on the floor or color-coding of the floor.

- Perform grounding in accordance with all applicable electrical codes and technical standards for electrical facilities.

Failure to observe this instruction may result in fire and/or electric shock.
1 Safety
1.5 MOTOMAN Safety

WARNING

• Operation of the crane, sling, or forklift must be performed only by authorized personnel. Failure to observe this instruction may result in personal injury and/or equipment damage.

• Use a crane, in principle, to transport the manipulator.
  – Before lifting the manipulator, make sure to securely fix the manipulator by using the shipping bolts and brackets and set the manipulator's posture for transportation as described in the MOTOMAN-□□□ INSTRUCTIONS of the manipulator.
  – Lift the manipulator by using a two-leg bridle sling hooked to the eyebolts attached to the shipping brackets or the manipulator body.
Failure to observe this instruction may cause overturning of the manipulator during transportation, which may result in personal injury and/or equipment damage.

• Lift, move, or install the YRC1000micro by two or more persons.
  – Approx. mass of YRC1000micro: 10.5 kg per unit
• Use a platform truck to carry the YRC1000micro.
  – Avoid jarring, dropping, or hitting the YRC1000micro during handling.
Failure to observe this instruction may cause falling or overturning of the YRC1000micro during transportation, which may result in personal injury and/or equipment damage.

• If storing the manipulator temporarily before installation, be sure to place it on a stable and flat surface and take precautions to prevent unauthorized personnel from touching it.
Failure to observe this instruction may cause overturning of the manipulator, which may result in personal injury and/or equipment damage.
1 Safety
1.5 MOTOMAN Safety

WARNING

• Secure enough space for maintenance on the manipulator, the YRC1000micro, and other peripheral devices. Failure to observe this instruction may result in personal injury during maintenance.

Installation space for YRC1000micro in horizontal position

Installation space for YRC1000micro in vertical position

• Install the YRC1000micro and the positioner control panel, etc. in a place from where the movement of the manipulator can easily be checked visually and the manipulator can be operated safely. Failure to observe this instruction may cause improper operation, which may result in personal injury.

• Install the YRC1000micro outside the safety fence around the manipulator. Failure to observe this instruction may cause contact with the manipulator, which may result in personal injury.

SHOULD HAVE SAME ORDER NUMBER.
ORDER.NO.
THE MANIPULATOR AND THE CONTROLLER
NJ1530
NJ3371

Can cause muscle strain or back injury. Use lifting aids & proper lifting techniques when removing or replacing.
1 Safety
1.5 MOTOMAN Safety

WARNING

- To install the manipulator, use the bolts and screws of the types and sizes specified in the MOTOMAN-□□□ INSTRUCTIONS of the manipulator.
Failure to observe this instruction may cause overturning of the manipulator, which may result in personal injury and/or equipment damage.

- After installing the YRC1000micro, firmly anchor it to the floor or baseplate by using the screws and the tapped holes on the lateral bottom of the YRC1000micro.
Failure to observe this instruction may cause overturning of the YRC1000micro, which may result in personal injury and/or equipment damage.

- Perform wiring to the YRC1000micro with a thorough understanding of and in accordance with the connection diagram.
Failure to observe this instruction may cause improper wiring and/or unexpected movement of the manipulator, which may result in personal injury and/or equipment damage.
1 Safety
1.5 MOTOMAN Safety

**WARNING**

- Run the piping, wiring, and cables for the YRC1000micro, the manipulator, the positioner control panel, peripheral devices, etc. in a pit so that they are not stepped on by personnel or run over by a forklift.

Failure to observe this instruction may cause personnel to trip over exposed piping, wiring, or a cable, which may result in personal injury. Failure to observe this instruction may also cause damage to piping, wiring, or a cable and unexpected movement of the manipulator, which may result in personal injury and/or equipment damage.
1.5.2 Work Area Safety

Carelessness contributes to serious accidents in the work area. To ensure safety, enforce the following precautions:

---

**DANGER**

- The manipulator may stop its movement while waiting for a condition to be satisfied during operation. In this case, the manipulator starts its movement again immediately after the condition is satisfied, thus it is dangerous to come close to the manipulator even if it is not moving. Make sure to clearly indicate that the manipulator is in operation by using a pilot lamp and/or an audible alert so that the operator does not come close to the manipulator, or make sure that the manipulator stops its operation if the operator comes close to it.

- Install safety fences around the manipulator to prevent any accidental contact with the manipulator while the power is ON. Display a warning sign stating “Off-Limits During Operation” at the entrance of the safety fence. The gate of the safety fence must be equipped with a safety interlock (safety plug) to turn the servo power OFF when the gate opens. Make sure that the interlock operates properly before use. For details of installation, refer to chapter 14.1.1.1 “Connection of Safety Plug Signal (SAFF)”.

- For areas not enclosed by safety fences, use a photoelectric sensor, a safety light curtain, etc. to make sure that the manipulator stops its operation if the operator enters its operating range.

Failure to observe this caution may result in a serious accident due to contact with the manipulator.

---

**CAUTION**

- Store industrial tools, etc. in a safe location outside the manipulator’s operating range. If an industrial tool, etc. is left unattended on the manipulator, on a fixture, or on the floor, etc., the manipulator may come in contact with the industrial tool left unattended, which may result in damage to the manipulator and/or the fixture.

- If the light in the operator’s working space is not bright enough, provide the space with appropriate lighting.
### 1.5.3 Operation Safety

#### DANGER

- Make sure to incorporate the robot system into the user’s system which has lockout/tagout function. That is to say, supply one or more devices to turn OFF the power supply of the manipulator, servo track, and controller, and install them outside the enclosure in which the manipulator and servotrack are installed. The devices must be able to be locked out and tagged out.

Turning the power ON improperly during work may result in electric shock or personal injury due to unexpected movement of the manipulator.

- Use the MOTOMAN only within the specifications described in the manuals for MOTOMAN.

Failure to observe this instruction may result in personal injury and/or equipment damage.

- Perform teaching operation from outside the manipulator’s operating range whenever possible.

- Observe the following precautions when performing a teaching operation within the manipulator’s operating range:
  - Be sure to perform lockout by putting a lockout device on the safety fence when going into the area enclosed by the safety fence. In addition, the operator of the teaching operation must display the sign that the operation is being performed so that no other person closes the safety fence.
  - View the manipulator from the front whenever possible.
  - Always follow the predetermined operating procedure.
  - Always keep in mind emergency response measures against the manipulator’s unexpected movement toward a person.
  - Ensure a safe place to retreat in case of emergency.

Failure to observe this instruction may cause improper or unintended movement of the manipulator, which may result in personal injury.

- Before operating the manipulator, make sure the servo power is turned OFF by performing the following operations. When the servo power is turned OFF, the SERVO ON LED on the programming pendant is turned OFF:
  - Press the emergency stop button on the programming pendant or on the external control device, etc.
  - Disconnect the safety plug of the safety fence. (when in the play mode or in the remote mode)

If operation of the manipulator cannot be stopped in an emergency, personal injury and/or equipment damage may result.
In the case of not using the programming pendant, be sure to supply the emergency stop button on the equipment. Then before operating the manipulator, check to be sure that the servo power is turned OFF by pressing the emergency stop button. Connect the external emergency stop button to the 4-14 pin and 5-15 pin of the Safety connector (Safety).

Upon shipment of the YRC1000micro, this signal is connected by a jumper cable in the dummy connector. To use the signal, make sure to supply a new connector, and then input it. If the signal is input with the jumper cable connected, it does not function, which may result in personal injury or equipment damage.

Confirm that no person is present in the manipulator’s operating range and that the operator is in a safe location before:
- Turning ON the YRC1000micro power
- Moving the manipulator by using the programming pendant
- Running the system in the check mode
- Performing automatic operations

Personal injury may result if a person enters the manipulator’s operating range during operation.

Immediately press an emergency stop button whenever there is a problem. The emergency stop button is located on the upper right of the programming pendant.

Persons operating or inspecting the manipulator should be trained as required by applicable laws and company policies.

Refer to chapter 1.2 "Special Training".
### WARNING

- Perform the following inspection procedures prior to conducting manipulator teaching. If there is any problem, immediately take necessary steps to solve it, such as maintenance and repair.
  - Check for a problem in manipulator movement.
  - Check for damage to insulation and sheathing of external wires.
- After installing the manipulator, replacing parts, modifying the taught job, or modifying the robot system by changing the tool or a peripheral device, etc., make sure to perform the first operation of the manipulator at low speed, and confirm that there is no abnormal noise, abnormal vibration, or abnormal operation. If an error occurs, immediately turn OFF the YRC1000 micro power supply and inform the safety manager of the error.
- Return the programming pendant to a safe place after use. If the programming pendant is left unattended on the manipulator, on a fixture, or on the floor, etc., the Enable Switch may be activated due to surface irregularities of where it is left, and the servo power may be turned ON. In addition, in case the operation of the manipulator starts, the manipulator or the tool may hit the programming pendant left unattended, which may result in personal injury and/or equipment damage.
1.6 Notes for Moving and Transferring the MOTOMAN

When moving or transferring the MOTOMAN, observe the following safety precautions:

**DANGER**

- When relocating, transferring, or selling the MOTOMAN, make sure that the MOTOMAN is always accompanied by its manuals so that all users have access to necessary manuals.

  See chapter 1.3 “MOTOMAN Manual List” for a list of the manuals.

  If any of them is missing, contact your YASKAWA representative. The telephone numbers of our offices are listed on the back cover of this manual.

- If a warning label on the manipulator or the YRC1000micro is dirty and unreadable, clean the label to make it clearly readable. If a warning label has come off, put the label back in place. Note that some local laws and regulations may prohibit equipment operation if safety labels are not in place.

  Contact your YASKAWA representative if you require new warning labels.

- After the MOTOMAN is relocated, inspection by your YASKAWA representative is recommended.

  If installation or wiring of a device is incorrect, personal injury and/or equipment damage may result.
1.7 Notes on MOTOMAN Disposal

**DANGER**

- Do not modify the manipulator or the YRC1000micro. Failure to observe this instruction may cause fire, mechanical failure, or malfunction, which may result in personal injury and/or equipment damage.

**WARNING**

- Take precautionary measures to prevent the manipulator from overturning, such as anchoring it firmly, etc., even when temporarily storing it before disposal. Failure to observe this instruction may cause overturning of the manipulator, which may result in personal injury.

**NOTICE**

- When disposing of or recycling the MOTOMAN, follow the applicable national/local laws and regulations. This symbol is applicable for EU member states only. The wheelie bin symbol on this product, manual or its packaging indicates that at the end of life the product should enter the recycling system. It must be disposed at an appropriate collection point for electrical and electronic equipment (EEE) and should not be put in the normal waste stream.
2 Product Confirmation

2.1 Contents Confirmation

Confirm the contents of the delivery when the product arrives.

Standard delivery includes the following four (to six) items (Information for the content of optional goods is given separately):

- Manipulator (parts included)
- YRC1000micro (parts included)
  For supplied parts, refer to "YRC1000micro MAINTENANCE MANUAL (RE-CHO-A115) 5.3 Supplied Parts List".
- Manipulator Cable (between manipulator and the YRC1000micro)
- Complete Set of Manuals (in the CD-ROM which is connected to the USB connector)
- Programming pendant (optional)
- Programming pendant dummy connector (optional)

Fig. 2-1: Standard Four (to Six) Items
2.2 Order Number Confirmation

Confirm that the order number pasted on the manipulator and YRC1000micro are the same.

The order number plates are affixed to the figure below.

*The GP8 model is used in this example.
3 Installation

3.1 Handling Procedure

WARNING

- Lift, move, or install the YRC1000micro by two or more persons.
  - Approx. mass of YRC1000micro: 10.5 kg per unit
- Use a platform truck to carry the YRC1000micro.
  - Avoid jarring, dropping, or hitting the YRC1000micro during handling.
Failure to observe this instruction may cause falling or overturning of the YRC1000micro during transportation, which may result in personal injury and/or equipment damage.

NOTICE

- Avoid excessive vibration or shock while transporting or moving the YRC1000micro.
Failure to observe this instruction may adversely affect the performance of the YRC1000micro because it consists of precision components.

The mass of the YRC1000micro is indicated on the nameplate. The location and content of the nameplate is shown below.

Unpack and move the YRC1000micro by two or more persons.

Use a lifter to lift the YRC1000micro up to or put it down from the rack. Also, use a platform truck to carry the YRC1000micro.

- If the YRC1000micro must be manually carried, lifted up, or put down, two persons must hold the bottom of the YRC1000micro firmly.
3.2 Place of Installation

The conditions listed below must be met before installing the YRC1000micro.

- Ambient temperature must be 0 to 40°C during operation and -10 to 60°C during transportation and maintenance. Temperature change must be 0.3°C/min or less.
- Humidity must be low with no condensation (10~90%RH).
- Only a small amount of dirt, dust, cutting oil, organic solvent, oil fume, water or salt in the place. Especially, avoid adhesion of chemicals, cutting oil including coolant, rust preventive oil, organic solvent, etc. to the programming pendant.
- Free from flammable or corrosive liquid, gas, etc.
- Free from excessive shock, vibration, etc. (vibration: 0.5G or less)
- Free from large electrical noise. (An electrical noise source such as a TIG welding device must not be placed close to the YRC1000micro.)
- Free from excessive microwaves, ultraviolet rays, X-rays, or radiation.
- Altitude: 1000 m or less (To use the DX100 at the altitude over 1000 m, calculate the maximum ambient temperature by decreasing it by 1% per 100 m. The maximum allowable altitude is 2000 m. When the altitude is 2000 m, the maximum ambient temperature during operation is 36°C.)

**NOTE**

If the external electric noise applies, the alarm occurs and the manipulator may stop.

When the alarm occurs and the manipulator stops, “YRC1000micro MAINTENANCE MANUAL (RE-CHO-A115)” and reset the alarm.
3.3 Location

1. Install the YRC1000micro outside of the P-point maximum envelope of the manipulator (outside of the safety fence.)

*Fig. 3-1: Location of YRC1000micro*

- Install the YRC1000micro where the manipulator can be clearly seen during operation and can be operated safely.
- Install the YRC1000micro where its front panel can be operated easily.
- Install the YRC1000micro where it can be easily taken out of the rack for maintenance.
- Install the YRC1000micro where it can be inspected easily. (Make sure to secure the maintenance area.)
- Do not place any obstacles in the following:
  - within 100 mm from the rear panel (air outlet) of the YRC1000micro
  - within 100 mm from the front panel (air inlet) of the YRC1000micro
3  Installation

3.3  Location

THE MANIPULATOR AND THE CONTROLLER SHOULD HAVE SAME ORDER NUMBER.

ORDER No.  NJ4014-1
3.4 Installation Method

**WARNING**

- The length of the fixing screws for the YRC1000micro must be equal to or shorter than the thickness of the metal fitting + 5 mm. If the length exceeds the above, the components inside the YRC1000micro may be damaged.
  - Required screw size: M5 (length: equal to or shorter than the thickness of the metal fitting + 5 mm or less)
  - Required screw material: mild steel or higher-strength material
- Fix all the 8 fixing points to install the YRC1000micro.
- The YRC1000micro is free-standing type. Avoid jarring, dropping, or hitting the YRC1000micro when installing it.

Failure to observe these cautions may result in personal injury or equipment damage.

- The YRC1000micro is not dust-proof, drip-proof, or explosion-proof. Be sure to use it in the environment free from explosive gas, combustible gas, corrosive gas, condensation, and dust.

Failure to observe this caution may result in equipment damage.

- Do not get on top of the YRC1000micro.

Failure to observe this caution may result in personal injury or equipment damage.

**Fixing Method**

For the YRC1000micro in horizontal position, fix it to the rack by using the tapped holes on the right and left side of it.
3 Installation

3.4 Installation Method

- Should have the same order number.
- The manipulator and the controller NJ1530 and NJ3371 can cause muscle strain or back injury. Use lifting aids and proper lifting techniques when removing or replacing.

**WARNING**

- Type ERMR-3.
- Power supply: average 3-phase and 1-phase.
- AC200/220V (50/60Hz)
- kVA: Full Load Current A, Interrupt Current kA, Largest Load A, MAX. OCP Device Current Rating A, Short Circuit Current Rating kA

- Drawing No.
- Serial No.
- Date
- Approximate Mass

**Made in Japan**

4 Connection

### WARNING

- Make sure to incorporate the robot system into the user’s system which has lockout/tagout function. That is to say, supply one or more devices to turn OFF the power supply of the manipulator, servo track, and controller, and install them outside the enclosure in which the manipulator and servo track are installed. The devices must be able to be locked out and tagged out.

Turning the power ON improperly during work may result in electric shock or personal injury due to unexpected movement of the manipulator.

- The system must be grounded.

Failure to observe this instruction may result in fire and/or electric shock. Especially in the case where the YRC1000micro for European standards is used in Japan, difference in conditions related to electricity such as grounding methods may cause increase in leakage current, which may result in electric shock.

- Before wiring, make sure to turn OFF the primary power supply, and put up a warning sign. (e.g. DO NOT TURN THE POWER ON)

Failure to observe this warning may result in injury or electric shock.

- Do not remove the top panel of the YRC1000micro.

Failure to observe this warning may result in injury or electric shock.

- Any occurrence during wiring of the YRC1000micro emergency stop circuit is the user’s responsibility. Do an operation check once the wiring is completed.

Failure to observe this warning may result in personal injury or mechanical failure.

- Wiring must be performed only by authorized personnel.

Incorrect wiring may result in fire or electric shock.

- Perform wiring in accordance with the rated capacity as specified in the Instructions.

Incorrect wiring may result in fire or mechanical failure.

- Do not handle the circuit board directly by hand.

The IC board may malfunction due to electrostatics.

### NOTICE

- Do not touch the circuit board directly by hand.

Failure to observe this instruction may result in malfunction of the IC due to static electricity.
4.1 Notes on Cable Junctions

- The cables that connect the controller to peripheral device are low voltage circuits. Keep controller signal cables away from the primary power circuit. High voltage power lines should not be run in parallel to controller signal cables. If running parallel cables is unavoidable, use metal ducts or conduit to isolate electrical signal interference. If cables must be crossed, run the power cables perpendicular across the signal cables.

- Confirm the connector and cable numbers to prevent mis-connection and equipment damage. One connects the manipulator and YRC1000micro. Another connects the YRC1000micro and peripheral device. A wrong connection can cause damage to electronic equipment.

- Clear the area of all unauthorized personnel while making cable connections. Place all cables in a covered cable channel in the floor.

*Fig. 4-1: YRC1000micro Cable Junction Diagram*
4.2 Power Supply

4.2.1 Power Supply

The three-phase power supply comprising 200/220 VAC at 50/60 Hz is used.

The single-phase power supply comprising 200/230 VAC at 50/60 Hz can also be used for the following models:

MotoMINI, GP7, GP8

Fig. 4-2: Input Power Connection

* Following models correspond single-phase
GP7, GP8, MotoMINI

**NOTE**

The power failure processing circuit operates when there is a black out or drop in voltage, and the servo power turns OFF.

Connect the power supply to a stable power source that is not prone to power fluctuations.

**WARNING**

• The system must be grounded.

Failure to observe this instruction may result in fire and/or electric shock. Especially in the case where the YRC1000micro for European standards is used in Japan, difference in conditions related to electricity such as grounding methods may cause increase in leakage current, which may result in electric shock.
4.2.2 Noise Filter Installation

Insert the three-phase/single-phase noise filter into the primary station of the non-fuse breaker filter if noise coming from the power source is heard.

* Fig. 4-3: Connection of Three-Phase Noise Filter

* Following models correspond single-phase
  GP7, GP8, MotoMINI

**WARNING**

- The system must be grounded.

Failure to observe this instruction may result in fire and/or electric shock. Especially in the case where the YRC1000micro for European standards is used in Japan, difference in conditions related to electricity such as grounding methods may cause increase in leakage current, which may result in electric shock.
4.2.3 Leakage Breaker Installation

When connecting the leakage breaker to the controller power supply wiring, use a leakage breaker which can handle high frequencies from the YRC1000micro inverter. Leakage breakers which cannot handle high frequencies may malfunction.

Table 4-1: Example of High Frequency Leakage Breaker

<table>
<thead>
<tr>
<th>Maker</th>
<th>Model</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mitsubishi Electric Co., Ltd.</td>
<td>NV class (manufactured in 1988 or later)</td>
</tr>
<tr>
<td>Fuji Electric Co., Ltd.</td>
<td>EG, SG Series (manufactured in1984 or later)</td>
</tr>
</tbody>
</table>

Even with a leakage breaker installed, there is still a possibility of some high frequency current leakage from the YRC1000micro inverter. However, this current leakage presents no safety risks.

Fig. 4-4: Connection of the Leakage Breaker

* Following models correspond single-phase
GP7, GP8, MotoMINI
4.2.4 Primary Power Supply Breaker Installation

Install the primary power supply breaker as shown below.

**WARNING**

- Make sure to incorporate the robot system into the user’s system which has lockout/tagout function. That is to say, supply one or more devices to turn OFF the power supply of the manipulator, servo track, and controller, and install them outside the enclosure in which the manipulator and servo track are installed. The devices must be able to be locked out and tagged out.

Turning the power ON improperly during work may result in electric shock or personal injury due to unexpected movement of the manipulator.

*Fig. 4-5: Installation of the Primary Power Supply Breaker*

The maximum load value (payload, operation speed, and frequency, etc.) is displayed. However, the power capacity is different depending on work conditions. Inquire at the nearest branch office listed on the back cover for information when selecting the transformer.
4 Connection
4.2 Power Supply

**NOTE**
The power capacity shown above is the continuous rating value.
When the manipulator is rapidly accelerated, the power capacity of several times the continuous rating value may be needed instantly.

**SUPPLEMENT**
The power capacity is changed when using an external axis.
For details of the power capacity with an external axis, please contact your YASKAWA representative or check the rated value name plate on the controller.
4.3 Connection Methods

A connection diagram between the manipulator and the YRC1000micro (manipulator cable), the primary power supply and the YRC1000micro (primary power supply cable), and between the YRC1000micro and the programming pendant (programming pendant cable) are shown below.

Please be noted that the programming pendant and the programming pendant cable are optional.

For their connection methods, refer to the following.

*Fig. 4-6: Cable Connection*

### 4.3.1 Connecting the Primary Power Supply

- **Power Cable Connection**
  1. Prepare the primary power supply cable by using the manipulator cable using the primary power supply-side connector delivered with the YRC1000micro.
  
  Refer to table 4-3(a) “For Three-Phase Power Supply (ACIN)” and table 4-3(b) “For Single-Phase Power Supply (ACIN) (Only for GP7, GP8 and MotoMINI)” for the pin assignment of the YRC1000micro.

  **Model of YRC1000micro Power Supply Connector (ACIN)**
  - YRC1000micro-side connector: CE05-2A18-10PD-D
  - Primary power supply-side connector: CE05-8A18-10SD-D-BAS
  
  Manufactured by DDK (the supplied part of the YRC1000micro)

  When mounting the YRC1000micro vertically, prepare a straight type connector.

*Fig. 4-7: Power Supply Connector (ACIN)*
4 Connection
4.3 Connection Methods

2. Confirm that the circuit protector of the YRC1000micro is turned OFF.
3. Confirm that the primary power supply is turned OFF.
4. Connect the primary power supply cable.

DANGER

- Make sure to use the supplied connector for the primary power supply connection.
- Tighten the cable clamp to prevent the cable from breaking.

Failure to observe these cautions may result in electric shock or equipment failure.

(1) Grounding method:
- Perform grounding as countermeasures against noise and electric shock.
- Follow the steps below:
  I) Connect the ground wire to the D terminal of the YRC1000micro power connector (ACIN).
  II) Perform grounding in accordance with all relevant local and national electrical codes. The size of ground wire must the same as listed on table 4-2 “YRC1000micro Power Capacity, Cable Sizes, and Breaker Capacities”.

NOTE

The ground wire must be supplied by the user.
4 Connection
4.3 Connection Methods

Fig. 4-8: Exclusive Grounding

Exclusive grounding (ground resistance: 100 ohms or less)

Do not connect the ground wire with the wires for the electric power source, the welder, etc.

If using metallic ducts, metallic conduits, or cable trays for cabling, perform grounding in accordance with all relevant governmental regulations.
4.3 Connection Methods

4.3.2 Connecting the Manipulator Cable

1. Remove the package, and take out the manipulator cable. Connect the cable to the connector on the back side of YRC1000micro.

   (1) Confirm that the connector lever of manipulator cable is at the initial position. Then insert the manipulator cable straight into the connector on the front side of the YRC1000micro. (The connector is connected in the state that it is turned 90 degrees to the left.)

      – Insert the manipulator cable to a fixed depth, then the lever rotate about 30 degrees forward automatically.

   (2) Push the lever with the hand and turn it 30 degrees approx. to lock it. Then press the positions as following figure to confirm the lever is locked.

      When pull out the connector, push the unlock part of the lever to unlock and turn the lever about 60 degrees to return to the initial position. Then pull out the connector straight.

   Fig. 4-9: Connection of the Manipulator Cable

<table>
<thead>
<tr>
<th>Inserting</th>
<th>Removing</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="inserting.png" alt="" /></td>
<td><img src="removing.png" alt="" /></td>
</tr>
</tbody>
</table>

Initial position of lever

Rotate automatically

Press these positions. Confirm the lever is locked.

Rotate manually

Push the unlock part

Pull out
2. Connect the manipulator cable to the YRC1000micro.
   - Confirm the connector number of manipulator cable. Push the cable connector into the manipulator side connector firmly, and then tighten it securely.

**WARNING**

- The top panel of the YRC1000micro should be kept closed unless, its optional board is added or replaced.

Failure to observe this warning may result in electric shock or mechanical failure.
4.3.3 Connecting Programming Pendant (Optional)

1. Connect the programming pendant cable to the connector connection (-X81) on the front panel of the YRC1000micro.

*Fig. 4-10: Connection of Programming Pendant Cables*

The manipulator, YRC1000micro, and programming pendant connections are now complete.

If the programming pendant is not used, connect the programming pendant dummy connector to the connector connection (-X81).
5 Turning ON and OFF the Power Supply

5.1 Turning ON the Main Power Supply

The main power supply is turned ON when the main power supply switch of the YRC1000micro is turned to "ON" position, and then the initial diagnosis are performed in the YRC1000micro and the startup window is shown on the programming pendant screen.

*WARNING*

- When turning ON the YRC1000micro power, confirm that no person is present in the manipulator's operating range and that the operator is in a safe location.

Personal injury may result if a person enters the manipulator's operating range during operation. Immediately press an emergency stop button whenever there is a problem. The emergency stop button is located on the upper right of the programming pendant.

The main power supply is turned ON when the main power supply switch of the YRC1000micro is turned to "ON" position, and then the initial diagnosis are performed in the YRC1000micro and the startup window is shown on the programming pendant screen.

Fig. 5-1: Main Power Supply
5 Turning ON and OFF the Power Supply
5.1 Turning ON the Main Power Supply

5.1.1 Initial Diagnosis

The initial diagnosis are performed in the YRC1000micro when main power is turned ON, and the startup window is shown on the programming pendant screen.

*Fig. 5-2: Startup Window*

[Image of Startup Window]

**NOTE**
The start-up window on the programming pendant may change without any notification.

5.1.2 When Initial Diagnosis Are Complete

When the power supply is turned OFF, the YRC1000micro saves all condition data, including:

- Mode of operation
- Called job (active job if the YRC1000micro is in the play mode; edit job if the YRC1000micro is in the teach mode) and the cursor position in the job.

*Fig. 5-3: Initial Window*

[Image of Initial Window]
5 Turning ON and OFF the Power Supply
5.1 Turning ON the Main Power Supply

WARNING

- Make sure that a system administrator stores the key of the Mode Switch of the programming pendant. After operation is completed, the key must be removed and stored by the system administrator.

Failure to observe this instruction may result in personal injury due to inappropriate or unintended manipulator's operation. If the programming pendant is dropped with the key inserted, the key or the Mode Switch may be damaged.
5.2 Turning ON the Servo Power

5.2.1 During Play Mode

The worker’s safety is secure if the safety plug of the safety fence is turned ON.

- When the safety fence is closed, press [SERVO ON READY] on the programming pendant to turn ON the servo power supply. [SERVO ON] lamp will light, when the servo power is turned ON.

![SERVO ON READY Light](image)

**NOTE** When the safety fence is open, the servo power supply cannot be turned ON.

5.2.2 During Teach Mode

1. Press [SERVO ON READY] on the programming pendant to turn ON the servo power supply. [SERVO ON] lamp will flicker when the servo power is turned ON.

![SERVO ON READY Flicker](image)

2. The servo power is turned ON and [SERVO ON] lamp on the programming pendant lights up when the operator grips the Enable switch.

![Enable Switch](image)

3. The servo power is turned OFF and [SERVO ON] lamp turns OFF on the programming pendant when the operator releases the Enable switch. Perform the steps 1 and 2 to turn ON the servo power again.
5 Turning ON and OFF the Power Supply
5.2 Turning ON the Servo Power

Servo Power ON/OFF --- Enable Switch

When the operator grips the Enable switch, the servo power turns ON. However, if the operator squeezes the switch until a “click” is heard, the servo power will turn OFF.

NOTE

When performing emergency stop using the programming pendant or external signal, the servo power-on operation from the Enable switch is canceled. When turning the power back ON, follow the previously listed instructions.

- The Valid / Invalid setting of safety signals in operation modes.

Safety functions of the robot system are switched to valid or invalid depending on its operation mode. Particularly in teach mode, be aware that the safety plug signal input becomes invalid, and then perform the operation with great caution.

5.3 Turning OFF the Power Supply

5.3.1 Turning OFF the Servo Power (Emergency Stop)

The manipulator cannot be operated when the emergency stop button is pressed and the servo power supply is turned OFF.

- Press the emergency stop button and the servo power supply is turned off.
  The emergency stop button is located on the upper right of the programming pendant.

- The brake operates once the servo power supply is turned OFF, and the manipulator can no longer operate.
  The emergency stop mode can be operated at any mode.
  (Teach mode, Play mode, Remote mode)

5.3.2 Turning OFF the Main Power

After turning OFF the servo power, turn OFF the main power.

- When the main power switch of the YRC1000micro is turned to “OFF” position, the main power is turned OFF.

---

**NOTE**

When an hour glass pointer is appearing on the programming pendant screen, the data writing is in process.
If turn the YRC1000micro power supply OFF during the data writing, the data may be broken. Do not turn the power supply OFF when the hour glass pointer is seen on the programming pendant.
5.3.3 The Method of Stopping Manipulator Operation

The following 3 categories are stop functions of the manipulator.

– Stop Category 0
  The immediate insulation of the motor power source to servo motor causes the stop.
  After the motor power is insulated, the manipulator and the external axis decelerate by the brake and stop.
  The manipulator and the external axis may run off the operation path (Path).

– Stop Category 1
  The manipulator and the external axis are controlled on the operation path, decelerate and then stop.
  After the stop, the manipulator and the external axis are locked by the brake and the motor power is insulated.

– Stop Category 2
  The manipulator and the external axis are controlled on the operation path, decelerate and then stop.
  After the stop, the stop position is retained in a state that the motor power is being supplied.

Besides the safety signals, the YRC1000micro robotic system stops the manipulator by the above three stop categories.

The method of stopping the manipulator by each stop signal is shown in the following table.
5 Turning ON and OFF the Power Supply
5.3 Turning OFF the Power Supply

</tbody>
</table>

**WARNING**

When the stop category 1 is used, the stopping distance and the stopping time are longer than those with the stop category 0. Thus, when using the stop category 1, perform the risk assessment of the whole system by considering increased stopping distance and stopping time.
6 Test of Program Operation

**DANGER**

- Before operating the manipulator, make sure the servo power is turned OFF by performing the following operations. When the servo power is turned OFF, the SERVO ON LED on the programming pendant is turned OFF.
  - Press the emergency stop button on the programming pendant or on the external control device, etc.
  - Disconnect the safety plug of the safety fence. (when in the play mode or in the remote mode)
If operation of the manipulator cannot be stopped in an emergency, personal injury and/or equipment damage may result.

- Observe the following precautions when performing a teaching operation within the manipulator's operating range:
  - Be sure to perform lockout by putting a lockout device on the safety fence when going into the area enclosed by the safety fence. In addition, the operator of the teaching operation must display the sign that the operation is being performed so that no other person closes the safety fence.
  - View the manipulator from the front whenever possible.
  - Always follow the predetermined operating procedure.
  - Always keep in mind emergency response measures against the manipulator's unexpected movement toward a person.
  - Ensure a safe place to retreat in case of emergency.

Failure to observe this instruction may cause improper or unintended movement of the manipulator, which may result in personal injury.

- Confirm that no person is present in the manipulator's operating range and that the operator is in a safe location before:
  - Turning ON the YRC1000 micro power
  - Moving the manipulator by using the programming pendant
  - Running the system in the check mode
  - Performing automatic operations

Personal injury may result if a person enters the manipulator's operating range during operation. Immediately press an emergency stop button whenever there is a problem. The emergency stop button is located on the upper right of the programming pendant.
DANGER

• In the case of not using the programming pendant, be sure to supply the emergency stop button on the equipment. Then before operating the manipulator, check to be sure that the servo power is turned OFF by pressing the emergency stop button. Connect the external emergency stop button to the 4-14 pin and 5-15 pin of the Safety connector (Safety).

• Upon shipment of the YRC1000micro, this signal is connected by a jumper cable in the dummy connector. To use the signal, make sure to supply a new connector, and then input it.

If the signal is input with the jumper cable connected, it does not function, which may result in personal injury or equipment damage.

WARNING

• Perform the following inspection procedures prior to conducting manipulator teaching. If there is any problem, immediately take necessary steps to solve it, such as maintenance and repair.
  – Check for a problem in manipulator movement.
  – Check for damage to insulation and sheathing of external wires.

• Return the programming pendant to a safe place after use.

If the programming pendant is left unattended on the manipulator, on a fixture, or on the floor, etc., the Enable Switch may be activated due to surface irregularities of where it is left, and the servo power may be turned ON. In addition, in case the operation of the manipulator starts, the manipulator or the tool may hit the programming pendant left unattended, which may result in personal injury and/or equipment damage.

• Make sure that a system administrator stores the key of the Mode Switch of the programming pendant. After operation is completed, the key must be removed and stored by the system administrator.

Failure to observe this instruction may result in personal injury due to inappropriate or unintended manipulator’s operation. If the programming pendant is dropped with the key inserted, the key or the Mode Switch may be damaged.
6.1 Movement of the Axes

Move each axis of the manipulator by pressing the axis keys on the programming pendant.

This figure illustrates each axis of motion in the joint coordinates.

**NOTE**

Be sure to remove all items from the area before moving the manipulator.
For details on the appropriate position of the fixture, the INSTRUCTIONS for the manipulator.
6 Test of Program Operation
6.2 Manual Brake Release Function

6.2 Manual Brake Release Function

When the manipulator moves to unexpected places because of system or operation errors and the operation cannot be maintained, using the brake release unit (optional) enables to release the brake of the arbitrary working axis of the manipulator and operate manually.

Table 6-1: Brake Release Unit (Separate Unit Type)

<table>

This brake release unit can be used in a state that the motor servo ON cannot be executed from the YRC1000 microcontroller.

Be very careful about the followings when using.

DANGER

- Before performing brake-release operation for a manipulator, carefully read the MOTOMAN-INSTRUCTIONS of the manipulator, and securely fix the axis whose brake will be released.

When the brake is released, depending on the axis and its posture, the axis may fall down due to its own weight or may abruptly move upward due to the attached balancer or weight, which may result in personal injury and/or equipment damage.

- Release the brake of only one axis at one brake-release operation.

If the brakes of two or more axes must be released simultaneously out of necessity, pay careful attention to ensure the safety of the surrounding operation environment because the manipulator’s arm may move in an unexpected way. Failure to observe this instruction may result in personal injury and/or equipment damage.

In case of purchase, inquire at the nearest YASKAWA branch office listed on the back cover.
System Up
7 Security System

7.1 Protection Through Security Mode Settings

The YRC1000micro modes setting are protected by a security system. The system allows the operation and the modification of settings depending on the level of the operator. Fully understand the operator's level to perform the proper operation and management.

7.1.1 Security Mode

There are five security modes "operation mode, editing mode, management mode, safety mode and one time manage mode". For the editing mode, management mode and safety mode, a user ID is required. For the editing mode and the management mode, the user ID must be 4 or more and 16 or less characters with number(s) and symbol(s). As for the safety mode, it must be 9 or more and 16 or less characters with number(s) and symbol(s).

(Significant numbers and symbols: "0 to 9", "-", ".").

Operating the one time manage mode requires to enter the security code, which is issued by YASKAWA sales representative.

<table>
<thead>
<tr>
<th>Security Mode</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operation Mode</td>
<td>This mode allows basic operation of the robot (stopping, starting, etc.) for people operating the robot work on the line.</td>
</tr>
<tr>
<td>Editing Mode</td>
<td>This mode allows the operator to teach and edit jobs and robot settings.</td>
</tr>
<tr>
<td>Management Mode</td>
<td>This mode allows those authorized to set up and maintain robot system: parameters, system time and modifying user IDs.</td>
</tr>
<tr>
<td>Safety Mode</td>
<td>This mode allows the operator to setup the safety function, and able to edit the files related to the safety function. When the optional function &quot;functional safety&quot; is valid, the security is changed to the safety mode to edit the some files, such as the tool file. Refer to &quot;YRC1000micro OPTIONS INSTRUCTIONS FOR FUNCTIONAL SAFETY FUNCTION (HW1484544)&quot; for more details.</td>
</tr>
<tr>
<td>One Time Manage Mode</td>
<td>This mode allows to operator to maintain the mode which is higher than the management mode. The loading limitation of the batch data (CMOS.BIN), the parameter batch data (ALL.PRM) and the functional definition parameter (FD.PRM) are removed.</td>
</tr>

1. Displayed in the teach mode only.
2. Displayed in the play mode only.
3. Displayed when the job reconstruction function is valid.

*As for the menu and the security mode when the functional safety is valid, refer to “YRC1000micro OPTIONS INSTRUCTIONS FOR FUNCTIONAL SAFETY FUNCTION (HW1484544)” for more details.
7.1.1.1 Changing the Security Mode

1. Select (SYSTEM INFO) under the main menu.
   - The sub menu appears.

2. Select (SECURITY).
   - The selection window of security mode appears.
7 Security System
7.1 Protection Through Security Mode Settings

– Security mode can be selected from “OPERATION MODE”, “EDITING MODE”, “MANAGEMENT MODE” or “SAFETY MODE”.

3. Select the security mode to change.
– If the selected security mode is lower than the current security level, the password will be required.

4. Enter the password.
– The following user ID numbers are set as default.
  Editing Mode: [0000000000000000]
  Management Mode: [9999999999999999]
  Safety Mode: [5555555555555555]

5. Press [ENTER].
– If the password is correct, the security mode will be changed.
7 Security System
7.1 Protection Through Security Mode Settings

- Procedures to Change the Mode to the One Time Management Mode

1. Change to the management mode.
   - When changing to the management mode, security mode can be selected from "OPERATION MODE", "EDITING MODE", "MANAGEMENT MODE", "SAFETY MODE" or "ONE TIME MANAGE MODE".

   ![Security Mode Selection](image1.png)

2. Select "ONE TIME MANAGE MODE".
   - A character string input keypad is displayed. Input the one time security code, which is issued by YASKAWA sales representative.
   - If the password is correct, the security mode will be changed.

   ![One Time Security Code Input](image2.png)
7 Security System
7.1 Protection Through Security Mode Settings

7.1.2 User ID

User ID is required for the operation of the editing mode, the management mode or the safety mode.

For the editing mode and the management mode, the user ID consists of 4 or more and 16 or less characters which are number(s) and symbol(s).
For the safety mode, the user ID consists of 9 or more and 16 or less characters which are number(s) and symbol(s).
(Significant numbers and symbols: “0 to 9”, “.”, “-”.)

7.1.2.1 Changing a User ID

The user ID can be modified only in the editing mode, management mode or safety mode. Higher security modes can modify the user ID of lower security modes.

1. Select {SETUP} under the main menu.
   – The sub menu appears.

2. Select {USER ID}.
   – The USER ID window appears.
7 Security System
7.1 Protection Through Security Mode Settings

3. Select the desired ID.
   - The character input line appears, and a message "Input current ID no. (4 or more digits)" appears.
     (As for the safety mode, 9 or more digits) Select the desired ID.

4. Input the current ID and press [ENTER].
   - When the correct user ID is entered, a new ID is requested to be input. "Input new ID no. (4 or more digits)" appears.
     (As for the safety mode, 9 or more digits)

5. Input new ID and press [ENTER].
   - User ID is changed.
7 Security System
7.1 Protection Through Security Mode Settings

7.1.3 Main CPU SD Card ID

This section explains about the display of the Main CPU SD Card ID. The main CPU SD Card ID is necessary to issue the one time security code.

1. Change the security mode to the management mode.

2. Select {SYSTEM INFO} in the main menu.
   – The sub menu appears.
3. Select {VERSION}.
   – VERSION window appears.
4. Select (UTILITY) under the pull-down menu.
   - “SD Card ID” appears.

5. Select “SD Card ID”.
   - SD Card ID dialog of the main CPU appears.

8 System Setup

WARNING

- Data related to the system's basic functions can be modified; however, inappropriate modification may cause fatal incident or failure for the manipulator or the whole system.

Before performing system setup, carefully read and understand the instructions, and make sure to observe the following precautions.

- System setup must be performed under the supervision of the administrator.

NOTICE

- Make sure to perform data storage and management whenever creating or modifying data. (Use our recommended SD card.)
- YASKAWA is not responsible for any incident or failure caused by inappropriate setting of data.
8.1 Home Position Calibration

DANGER

- Before operating the manipulator, make sure the servo power is turned OFF by performing the following operations. When the servo power is turned OFF, the SERVO ON LED on the programming pendant is turned OFF.
  - Press the emergency stop button on the programming pendant or on the external control device, etc.
  - Disconnect the safety plug of the safety fence.
  (when in the play mode or in the remote mode)
If operation of the manipulator cannot be stopped in an emergency, personal injury and/or equipment damage may result.
- Observe the following precautions when performing a teaching operation within the manipulator's operating range:
  - Be sure to perform lockout by putting a lockout device on the safety fence when going into the area enclosed by the safety fence. In addition, the operator of the teaching operation must display the sign that the operation is being performed so that no other person closes the safety fence.
  - View the manipulator from the front whenever possible.
  - Always follow the predetermined operating procedure.
  - Always keep in mind emergency response measures against the manipulator’s unexpected movement toward a person.
  - Ensure a safe place to retreat in case of emergency.
Failure to observe this instruction may cause improper or unintended movement of the manipulator, which may result in personal injury.
- Confirm that no person is present in the manipulator's operating range and that the operator is in a safe location before:
  - Turning ON the YRC1000micro power
  - Moving the manipulator by using the programming pendant
  - Running the system in the check mode
  - Performing automatic operations
Personal injury may result if a person enters the manipulator's operating range during operation. Immediately press an emergency stop button whenever there is a problem. The emergency stop button is located on the upper right of the programming pendant.
8 System Setup
8.1 Home Position Calibration

**DANGER**

- In the case of not using the programming pendant, be sure to supply the emergency stop button on the equipment. Then before operating the manipulator, check to be sure that the servo power is turned OFF by pressing the emergency stop button. Connect the external emergency stop button to the 4-14 pin and 5-15 pin of the Safety connector (Safety).

- Upon shipment of the YRC1000micro, this signal is connected by a jumper cable in the dummy connector. To use the signal, make sure to supply a new connector, and then input it.

If the signal is input with the jumper cable connected, it does not function, which may result in personal injury or equipment damage.

**WARNING**

- Perform the following inspection procedures prior to conducting manipulator teaching. If there is any problem, immediately take necessary steps to solve it, such as maintenance and repair.
  - Check for a problem in manipulator movement.
  - Check for damage to insulation and sheathing of external wires.

- Return the programming pendant to a safe place after use.

If the programming pendant is left unattended on the manipulator, on a fixture, or on the floor, etc., the Enable Switch may be activated due to surface irregularities of where it is left, and the servo power may be turned ON. In addition, in case the operation of the manipulator starts, the manipulator or the tool may hit the programming pendant left unattended, which may result in personal injury and/or equipment damage.

- Make sure that a system administrator stores the key of the Mode Switch of the programming pendant. After operation is completed, the key must be removed and stored by the system administrator.

Failure to observe this instruction may result in injury due to inappropriate or unintended manipulator's operation. If the programming pendant is dropped with the key inserted, the key or the Mode Switch may be damaged.
8.1 Home Position Calibration

8.1.1 Home Position Calibration

Teaching and playback are not possible before the completion of the home position calibration. In a system with two or more manipulators, the home position of all the manipulators must be calibrated before starting teaching or playback.

Home position calibration is an operation in which the home position and absolute encoder position coincide. Although this operation is performed prior to shipment at the factory, it needs to be performed again for following cases.

• Change the combination of the manipulator and YRC1000micro
• Replacement of the motor or absolute encoder
• Stored memory is cleaned. (by weak battery, etc.)
• Home position deviation caused by hitting the manipulator against a workpiece, etc.

To calibrate the home position, use the axis keys to calibrate the home position mark on each axis so that the manipulator can take its posture for the home position. There are two operations for home position calibration:

• All the axes can be moved at the same time: Recalibrate the home position by moving all the axes together if changing the combination of manipulator and circuit board.
• Axes can be moved individually: Recalibrate the home position for the individual axes that were affected by the replacement, if replacing the motor or absolute encoder.

If the absolute data of its posture for the home position is already known, set the absolute data again after completing home position registration.

Home Position

The home position is the position in which the pulse value is “0” for each axis and the posture at the position is the home position posture. See chapter 8.1.3 “Home Position Posture of Manipulator”.
8.1.2 Calibrating Operation

NOTE Home position calibration screen is shown only in the security mode or the management mode.

8.1.2.1 Registering All Axes at One Time

1. Select {ROBOT} under the main menu.
   - The sub menu appears

2. Select {HOME POSITION}.
   - The HOME POSITIONING window appears.
8 System Setup
8.1 Home Position Calibration

3. Select {DISPLAY} under the menu.
   – The pull-down menu appears.

4. Select the desired control group.
   – Select the control group for HOME POSITIONING.
   – The control group can also be selected by pressing [PAGE].
8. System Setup
8.1 Home Position Calibration

5. Select {EDIT} under the menu.
   – The pull-down menu appears.

6. Select {SELECT ALL AXES}.
   – The confirmation dialog box appears.

7. Select {YES}.
   – The position data of all axes which is shown are registered as home position. When {NO} is selected, the registration will be canceled.
8 System Setup
8.1 Home Position Calibration

8.1.2.2 Registering Individual Axes

1. Select (ROBOT) under the main menu.
   – The sub menu appears.

2. Select (HOME POSITION).

3. Select the desired control group.
   – Perform the step 3 and 4 of the “Registering All Axes at One Time” to select the desired control group.

4. Select the axis to be registered.
   – Move the cursor to the axis to be registered, and select it.

   - A confirmation dialog box appears.

5. Select (YES).
   – The position data of the axis which is shown is registered as home position. When (NO) is selected, the registration will be canceled.
8.1.2.3 Changing the Absolute Data

To change the absolute data of the axis for which the home position calibration is completed, perform the following:

1. Select {ROBOT} under the main menu.
2. Select {HOME POSITION}.
3. Select the desired control group.
   – By performing the step 3 and 4 of the “Registering All Axes at One Time”, the HOME POSITIONING window is shown and the desired control group can be selected.
4. Select the absolute data to be registered.
   – The number can be entered.
5. Enter the absolute data by using the numeric keys.
6. Press [ENTER].
   – Absolute data is modified.
8 System Setup
8.1 Home Position Calibration

8.1.2.4 Clearing Absolute Data

1. Select {ROBOT} under the main menu.
   – The sub menu appears

2. Select {HOME POSITION}.
   – By performing the step 2, 3 and 4 of the "Registering All Axes at One Time", the HOME POSITIONING window is shown and the desired control group can be selected.

3. Select {DATA} under the main menu.
   – The pull-down menu appears

4. Select [CLEAR ALL DATA].
   – A confirmation dialog box appears.
8 System Setup
8.1 Home Position Calibration

5. Select {YES}.

- All absolute data are cleared.
- When {NO} is selected, the registration will be canceled.
8.1.3 Home Position Posture of Manipulator

The home position posture of a commonly used 6-axis vertically-articulated manipulator is shown below.

The home position posture of each manipulator differs depending on its model. Refer to the INSTRUCTIONS for the manipulator corresponding to its model.
8.2 Setting the Second Home Position (Check Point)

**DANGER**

- Before operating the manipulator, make sure the servo power is turned OFF by performing the following operations. When the servo power is turned OFF, the SERVO ON LED on the programming pendant is turned OFF.
  - Press the emergency stop button on the programming pendant or on the external control device, etc.
  - Disconnect the safety plug of the safety fence.
    (when in the play mode or in the remote mode)

If operation of the manipulator cannot be stopped in an emergency, personal injury and/or equipment damage may result.

- Observe the following precautions when performing a teaching operation within the manipulator's operating range:
  - Be sure to perform lockout by putting a lockout device on the safety fence when going into the area enclosed by the safety fence. In addition, the operator of the teaching operation must display the sign that the operation is being performed so that no other person closes the safety fence.
  - View the manipulator from the front whenever possible.
  - Always follow the predetermined operating procedure.
  - Always keep in mind emergency response measures against the manipulator’s unexpected movement toward a person.
  - Ensure a safe place to retreat in case of emergency.

Failure to observe this instruction may cause improper or unintended movement of the manipulator, which may result in personal injury.

- Confirm that no person is present in the manipulator's operating range and that the operator is in a safe location before:
  - Turning ON the YRC1000micro power
  - Moving the manipulator by using the programming pendant
  - Running the system in the check mode
  - Performing automatic operations

Personal injury may result if a person enters the manipulator's operating range during operation. Immediately press an emergency stop button whenever there is a problem. The emergency stop button is located on the upper right of the programming pendant.

- Read and understand the Explanation of the Warning Labels before operating the manipulator.
8.2 Setting the Second Home Position (Check Point)

**DANGER**

- In the case of not using the programming pendant, be sure to supply the emergency stop button on the equipment. Then before operating the manipulator, check to be sure that the servo power is turned OFF by pressing the emergency stop button. Connect the external emergency stop button to the 4-14 pin and 5-15 pin of the Safety connector (Safety).
- Upon shipment of the YRC1000micro, this signal is connected by a jumper cable in the dummy connector. To use the signal, make sure to supply a new connector, and then input it.

If the signal is input with the jumper cable connected, it does not function, which may result in personal injury or equipment damage.

**WARNING**

- When performing the position check operation for the second home position (check point), pay careful attention to ensure the safety of the surrounding operation environment.

If the “OUT OF RANGE (ABSO DATA)” alarm occurs, an error in the encoder communication related components may be the cause of the alarm. In this case, the manipulator may move in an unexpected direction, which may result in personal injury and/or equipment damage.

- Perform the following inspection procedures prior to conducting manipulator teaching. If there is any problem, immediately take necessary steps to solve it, such as maintenance and repair.
  - Check for a problem in manipulator movement.
  - Check for damage to insulation and sheathing of external wires.
- Return the programming pendant to a safe place after use.

If the programming pendant is left unattended on the manipulator, on a fixture, or on the floor, etc., the Enable Switch may be activated due to surface irregularities of where it is left, and the servo power may be turned ON. In addition, in case the operation of the manipulator starts, the manipulator or the tool may hit the programming pendant left unattended, which may result in personal injury and/or equipment damage.
8.2.1 Purpose of Position Check Operation

If the absolute number of rotation detected at power supply ON does not match the data stored in the absolute encoder the last time the power supply was turned off, alarm 4107 “OUT OF RANGE (ABSO DATA)” is issued when the controller power is turned ON.

There are two possible causes of this alarm:

- An error was found in the encoder communication related components.
- No error was found in the encoder communication related components, but the manipulator was moved after the power supply was turned OFF.

If there is an error in the encoder communication related components, the manipulator may stall when playback is started. If the absolute data allowable range error alarm has occurred, playback and test runs will not function and the position must be checked.

1, Position Check

After the “OUT OF RANGE (ABSO DATA)” alarm occurs, move to the second home position using the axis keys and perform the position confirmation. For performing the position confirmation, refer to chapter 8.2.3 “Procedure after the Alarm”. Playback and test runs will not function unless “CONFIRM POSITION” is performed.
2, Pulse Difference Check
The pulse number at the second home position is compared with that at the current position. If the difference is within the allowable range, playback is enabled. If not, the alarm occurs again.

• The allowable range pulse is the number of pulses per rotation of the motor (PPR data).

• The initial value of the second home position is the home position (where all axes are at pulse 0). The second home position can be changed. For details, refer to chapter 8.2.2 “Procedure for the Second Home Position Setting (Check Point)”.

3, Alarm Occurrence
If the alarm occurs again, there may be an error in the encoder communication related components. Check the components. After adjusting the erroneous axis, calibrate the home position of the axis, and then check the position again.

• When the home position calibration for all the axes is performed at the same time, playback operations are possible without the position confirmation.

• For a system with a manipulator that has no brake, after the alarm occurs, there is a case that the playback operations are possible without the position confirmation. (However, as a rule, "CONFIRM POSITION" must be performed.)

Under the above special conditions, the manipulator moves as follows:

After starting, the manipulator moves at low speed (1/10 of the maximum speed) to the step indicated by the cursor.

If it is stopped and restarted during this motion, the low speed setting is kept until the step at cursor is reached. Regardless of cycle setting, the manipulator stops after the cursor step is reached.

When starting the manipulator again after it is stopped, the manipulator operates at the programmed speed and cycle of the job.
8.2.2 Procedure for the Second Home Position Setting (Check Point)

Apart from the “home position” of the manipulator, the second home position can be set up as a check point for absolute data. Perform the following steps to set the specified point.

If two or more manipulators or stations are controlled by one controller, the second home position must be set for each manipulator or station.

1. Select {ROBOT} under the main menu.
   – A sub menu appears.

2. Select {SECOND HOME POS}.
   – The SECOND HOME POS window appears.
   The message “Available to move to and modify specified point” is shown.

3. Press [PAGE], or select “PAGE” to display the selection window for the control group.
   – The group axes by which the second home position is set is selected when there are two or more group axes.

4. Press the axis keys.
   – Move the manipulator to the new second home position.

5. Press [MODIFY] and [ENTER].
   – The second home position is changed.
8.2.3 Procedure after the Alarm

If the “OUT OF RANGE (ABSO DATA)” alarm occurs, perform the followings:

- Reset the alarm
- Turn Servo power ON

And then confirm the second home position. After the confirmation, if the encoder communication related components are found to be the cause of the alarm, perform the necessary operations, such as replacing the encoder communication related components, etc.

The robot current position data when turning main power supply OFF and ON can be confirmed in “POWER ON/OFF POS” window.

Refer to “YRC1000micro MAINTENANCE MANUAL (RE-CHO-A115) 7.7 Position Data When Power is Turned ON/OFF” for details on the “POWER ON/OFF POS” window.

1. Select (ROBOT) under the main menu.
2. Select (SECOND HOME POS).
   - The SECOND HOME POS window appears.
3. Press the page key [PAGE], or select "PAGE" to display the selection window for the control group.
8.2 Setting the Second Home Position (Check Point)

- The group axes by which the second home position is set is selected when there are two or more group axes.

4. Press [FWD].
   - TCP moves to the second home position. The robot moving speed is set as selected manual speed.

5. Select {DATA} under the menu.
6. Select {CONFIRM POSITION}.
   - The message "Home position checked" is shown.
     Pulse data of the second home position and current pulse data are compared. If the compared error is in allowed range, playback operation can be done.
     If the error is beyond the allowed range, the alarm occurs again.
8 System Setup
8.2 Setting the Second Home Position (Check Point)

8.2.4 Procedure after the Alarm

WARNING

- When performing the position check operation, pay careful attention to ensure the safety of the surrounding operation environment.

An error in the encoder communication related components may be the cause of the alarm. In this case, the manipulator may move in an unexpected direction, which may result in personal injury and/or equipment damage.

If the “OUT OF RANGE (ABSO DATA)” alarm occurs:
- Reset the alarm;
- Turn ON the servo power;
then confirm the second home position. After the confirmation, if the encoder communication related components are found to be the cause of the alarm, perform the necessary operation, such as replacing the encoder, etc.

The robot current position data when turning main power supply OFF and ON can be confirmed in “POWER ON/OFF POS” window.

For details on the “POWER ON/OFF POS” window, refer to “YRC1000micro MAINTENANCE MANUAL (RE-CHO-A115) 7.7 Position Data When Power is Turned ON/OFF”.

1. Select (ROBOT) under the main menu.
   - The sub menu appears.
2. Select (SECOND HOME POS).
   - The SECOND HOME POS window appears.
3. Press the [PAGE], or select [PAGE] to open the selection window for the control group.

   – When there are two or more group axes, select the group axes to which the second home position is to be specified.

   ![Second Home Position Specified](image)

4. Press [FWD].

   – TCP moves to the second home position. The robot moving speed is set as selected manual speed.

5. Select {DATA} under the menu.

6. Select {CONFIRM POSITION}.

   – A message “Home position checked” appears.

   – Pulse data of the second home position and current pulse data are compared. If the compared error is in allowed range, playback operation can be done.

   – If the error is beyond the allowed range, the alarm occurs again.
8.3 Tool Data Setting

8.3.1 Registering Tool Files

8.3.1.1 Number of Tool Files

There are 64 tool files numbered 0 to 63. Each file is called as a tool file.

![Tool File Extension Function](image)

Tool File Extension Function
Normally, one robot uses one kind of tool file. The tool file extension function can change many tool files to be used by one robot. Use the following parameter to set this function.

\[ \text{S2C333: TOOL NO. SWITCHING (1: enabled; 0: disabled)} \]

For more details, refer to "YRC1000micro OPERATOR’S MANUAL (RE-CSO-A058) 8 Parameter".

8.3.1.2 Registering Coordinate Data

When registering the tool file by number input operation, input the TCP of the tool on the flange coordinates.
1. Select {ROBOT} under the main menu.
   - The sub menu appears.

2. Select {TOOL}.
   
   (1) Move the cursor to the number of the desired tool, and press \{SELECT\} in the tool list window.
   
   (2) The tool coordinate window of the selected number appears.
   
   - In the tool coordinate window, the tool number can be changed by pressing the [PAGE] or selecting [PAGE].

3. Select the desired tool number.

4. Place the cursor in the part to register the desired coordinate data and press [SELECT].
   
   - The number is ready to input.

5. Input the coordinate data.
6. Press [ENTER].

- The coordinate data is registered.

<Setting Example>

In case of Tool A, B

</tbody>
</table>
8.3.1.3 Registering Tool Posture Data

The tool posture data is an angle data which shows the relation between the flange coordinates and the tool coordinates. The angle when the flange coordinates are rotated to meet to the tool coordinates becomes an input value. Clockwise toward the arrow is the positive direction. Register in the following order: Rz, Ry, Rx.

For the tool shown in the following figure, register Rz=180, Ry=90, Rx=0

1. Select {ROBOT} under the main menu.
2. Select {TOOL}.
3. Select the desired tool number.
   – In the same way as shown in Explanation 2, 3 in chapter 8.3.1.2 “Registering Coordinate Data”, open the desired tool coordinate window.
4. Select the desired coordinate axis to modify.
   – First, select Rz.
5. Input the tool posture data.
   – Input rotation angle around Z_F of the flange coordinates.

<table>
<thead>
<tr>
<th>X</th>
<th>0.000 m</th>
<th>Rz</th>
<th>0.000 kg</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y</td>
<td>0.000 m</td>
<td>Ry</td>
<td>0.000 kg</td>
</tr>
<tr>
<td>Z</td>
<td>0.000 m</td>
<td>Rz</td>
<td>180.000 kg</td>
</tr>
</tbody>
</table>
6. Press [ENTER].
   – The rotation angle of Rz is registered.

   In the same way, register the angle of Ry, Rx.
   Ry must be the input rotation angle around Y'F flange coordinates.
   
   \[
   \text{Rx} = 0
   \]

   – Rx must be the input rotation angle around X'F of flange coordinates.

   \[
   \text{Ry} = 90
   \]

8.3.1.4 Setting the Tool Load Information

The tool load information includes weight, a center of gravity position, and moment of inertia at the center of gravity of the tool installed at the flange. Sets the tool load information by the design value of the tool.

For more details on the tool load information, refer to chapter 8.4.3 “Tool Load Information Setting”.

If the design value is uncertain, use of the “Automatic Measurement of the Tool Load and the Center of Gravity” enable to set the tool load information easily.

For more details on “Automatic Measurement of the Tool Load and the Center of Gravity”, refer to chapter 8.3.3 “Automatic Measurement of the Tool Load and the Center of Gravity”.

SUPPLEMENT

8-26
8.3.2 Tool Calibration

8.3.2.1 Tool Calibration

To ensure that the manipulator can perform motion type operations such as linear and circular motion type correctly, accurate dimensional information on tools such as a hand must be registered and the position of the TCP must be defined.

Tool calibration is a function that enables this dimensional information to be registered easily and accurately. When this function is used, the TCP is automatically calculated and registered in the tool file.

What is registered in tool calibration is the coordinates of the TCP and the tool posture data in the flange coordinates.

8.3.2.2 Setting of Tool Calibration Method

There are three tool calibration methods, which are selected by setting parameter.

S2C432: Designation of tool calibration method

0: Calibrates only the coordinates.
“Coordinates” calculated from 5 calibration teaching points is registered in the tool file.
In this case “Tool Posture Data” is all cleared to be 0.

1: Calibrates only the posture.
“Tool Posture Data” calculated from the first calibration teaching point is registered in the tool file.
In this case, “Coordinates” will not be changed. (the prior value is maintained.)

2: Calibrates the coordinates and the posture.
“Coordinates” calculated from 5 calibration teaching points and “Tool Posture Data” calculated from the first calibration teaching point are registered in the tool file.
8.3.2.3 Teaching of Calibration Point

- **Teaching for defining coordinates**
  In order to calibrate coordinates, five different postures (TC1 to 5) must be taught with the TCP as the reference point. The tool dimensions are automatically calculated on the basis of these five points.

Each posture must be arbitrary. Accuracy may decrease when pose setting is rotated in a constant direction.
Teaching for defining posture

The calibration of tool posture data is performed with the first calibration teaching point (TC1).

Teach TC1 with Z-axis of the desired tool coordinates downward vertically to the ground. (the Z-axis of the tool coordinates is parallel to the Z-axis of the base tool and points to the opposite direction.)

Tool posture data is automatically calculated with this TC1 posture.

The X-axis of the tool coordinates is defined in the same direction as the X-axis of the base coordinates.

![Diagram showing tool posture teaching points](image)

In case of calibrating with S2C432=2, teach TC1 with Z-axis of the desired tool coordinates downward vertically to the ground. Then teach the other calibration teaching points (TC2~TC5) with the all tool points meet at the TC1’s tool point as shown in the figure below.

If teaching in one place as the figure above is impossible due to the interference of peripheral equipment and so on, perform calibration of coordinates with S2C432=0 or 2, and then change to S2C432=1, teach only TC1 in a different position and register the tool posture data.
8 System Setup
8.3 Tool Data Setting

1. Select (ROBOT) under the main menu.
2. Select (TOOL).
3. Select the desired tool number.
   – In the same way as shown in the instruction 2 and 3 of the chapter 8.3.1.2 “Registering Coordinate Data”, display the desired tool coordinate window.

4. Select (UTILITY) under the menu.
   – The pull-down menu appears.
8. System Setup
8.3 Tool Data Setting

5. Select (CALIBRATION).
   – The TOOL CALIBRATION window is shown.

6. Select the robot.
   (1) Select the robot to calibrate.
       (When the robot has already been selected or there is only one of
        robot, this operation should not be performed.)
   (2) Select "***" in the TOOL CALIBRATION window and select the
       robot in the shown selection dialog box.
   (3) The robot is set.

Main Menu Simple Menu Turn on servo power
8 System Setup
8.3 Tool Data Setting

7. Select “POSITION”.
   – The selection dialog box is shown.
   (1) Select the teaching point for calibration.

8. Move the manipulator using the axis key.

9. Press [MODIFY] and [ENTER].
   – Taught position is registered.
   Repeat 7 to 9 operation to teach TC1 to TC5.
   “●” indicates that teaching is completed and “O” indicates that it is not completed.

   – To check the taught positions, call up the required window among TC1 to TC5 and press [FWD]. The manipulator moves to the set position.
   – If there is a difference between the current position of the manipulator and the shown position data, “TC□” next to “POSITION” in the window flashes.
10. Select “COMPLETE”.

- Calibration data is registered in the tool file. Once the calibration is completed, the tool coordinate window is displayed on the screen.
8.3.2.4 Clearing Calibration Data

Before the calibration of a new tool, clear the robot information and calibration data.

1. Select (DATA) under the pull-down menu.
   - The pull-down menu appears.

2. Select (CLEAR DATA).
   - The confirmation dialog box is shown.
3. Select {YES}.
   - All data is cleared.

If tool angle data is required, input the data number in the tool coordinate window. Refer to chapter 8.3.1.3 “Registering Tool Posture Data” for the operating instructions.

### 8.3.2.5 Checking the TCP

After registering the tool file, check if the TCP is correctly registered by performing a TCP fixed operation like the one shown below, in any coordinate system other than the joint.
8 System Setup
8.3 Tool Data Setting

1. Press [COORD].
   - Select any coordinate system except "JOINT" by pressing [COORD].

2. Select desired tool number.
   - Show the tool coordinate window of the desired tool by pressing the [PAGE] or selecting it in the tool list window.

3. Move the R, B, or T axes using the axis key.
   - By pressing the axis keys for the R, B, and T axes, change the manipulator pose without changing the TCP position. If this operation shows a large TCP error, adjust the tool data.

For details on the TCP fixed operation, refer to “YRC1000micro OPERATOR’S MANUAL (RE-CSO-A058) 2.3.7 Motion about TCP”.

SUPPLEMENT
For details on the TCP fixed operation, refer to “YRC1000micro OPERATOR’S MANUAL (RE-CSO-A058) 2.3.7 Motion about TCP”.

8-36
8.3.3 Automatic Measurement of the Tool Load and the Center of Gravity

8.3.3.1 What is the Automatic Measurement of the Tool Load and the Center of Gravity?

With this function, the user can register the load of tool, the position of the tool's center of gravity and the moment of inertia at the center of gravity. The tool load, the position of its center of gravity and the moment of inertia at the center of gravity are measured and registered in a tool file.

This function can be used where the manipulator is installed level on the ground. For the conditions required for manipulator installation, refer to chapter 8.4 “ARM Control”.

8.3.3.2 Measurement of the Tool Load and the Center of Gravity

To measure the tool load and the center of gravity, move the manipulator to its home position (U-, B- and R-axes: horizontal to the ground) and operate the U-, B- and T-axes.

To correctly measure the tool load or the center of gravity, remove the cables or wires connected to the tool. The measurement may not be performed properly because unnecessary loads are applied.
8 System Setup
8.3 Tool Data Setting

1. Select (ROBOT) under the main menu.

2. Select (TOOL).

   – The tool list window appears.
   
   – The tool list window is called up only when the file extension function is valid.

If the file extension function is invalid, the tool coordinate window appears.
3. Select the desired tool number.
   - Move the cursor to the desired number in the tool list window and press [SELECT].
   - The tool coordinate window of the selected number is shown.
   - In the tool coordinate window, the number can be changed by pressing the [PAGE] or selecting [PAGE].
   - To switch the tool list window and the tool coordinate window, press {DISPLAY} ➔ {LIST} or {DISPLAY} ➔ {COORDINATE DATA}.

4. Select {UTILITY} under the menu.
5. Select (W.GRAV.POS MEASURE).

- The window for the automatic measurement of the tool load and the center of gravity is shown.

6. Press the [PAGE].

- In a system with several manipulators, use the [PAGE] to change the group to be controlled.

7. Press [FWD].

- Press [FWD] once, and the manipulator moves to the home position (U-, B- and R-axes: horizontal to the ground).

- Press [FWD] again, and measurement starts. Keep the button pressed until measurement is completed.

The manipulator moves in the order listed below. Once measurement is completed, “○” changes to “●”.

1. Measurement of the U-axis: U-axis home position +4.5 degrees → -4.5 degrees
2. Measurement of the B-axis: B-axis home position +4.5 degrees → -4.5 degrees
3. First measurement of the T-axis: T-axis home position +4.5 degrees → -4.5 degrees
4. Second measurement of the T-axis: T-axis home position +60 degrees → +4.5 degrees → -4.5 degrees

- The speed during measurement automatically changes to "Medium”.
- During the measurement, "HOME“ or "U" blinks on the screen.
- During the measurement, the [FWD] button must be kept pressed. If the button is released during the measurement or if it is released before “○” changes into “●”, the measurement is aborted and the following message appears: "Stopped measurement"
- The measurement starts again from the first home position.
– When the measurement of the tool load and the center of gravity is completed (when all the measurement statuses of the tool load and the center of gravity has changed to “•”), the measured data appears on the screen.

9. Select “REGISTER”. (When measuring only the tool load and the center of gravity.)

– The measured data is registered in the tool file, and the tool coordinate window appears.

– Select “CANCEL” to open the tool list window without registering the measured data in the tool file.

– Select “FWD” and the manipulator moves to the home position 1 and the measurement of the moment of inertia at the center of gravity starts.
8.3.3 Measurement of the Moment of Inertia at the Center of Gravity

Measure the moment of inertia at the center of gravity.

The moment of inertia at the center of gravity does not need to be measured when this data is small enough for the moment of inertia calculated from weight and the center of gravity position. However, the measurement is required when the moment of inertia of the tool is large (as a rough guide, the tool is considered to be large when the tool size is about more than 2-times the distance between the flange and the center of gravity).

1. Press [FWD].

   - Press [FWD], and the manipulator moves to the home position 1 (U-axis: horizontal to the ground, R-axis: rotating axis of B-axis is vertical to the ground, T-axis: T-axis home position +90 degrees).

   The size of the tool is not too big. Measurement of the moment of inertia at center of gravity is not necessary.

   The size of the tool is big. Measurement of the moment of inertia at center of gravity is necessary.

NOTE

If the tool is interfered with during the measurement, operate the S-, L- and R-axes and move the manipulator to avoid the interference. Then move the axis to the home position 1.
   – Press [FWD] again, and measurement of B-axis 1 and B-axis 2 starts.
   The manipulator moves in the order listed below. Once measurement is completed, “O” changes to “●”:

   ① Measurement of the B-axis 1: B-axis home position +30 degrees → -30 degrees
   ② Move to the measurement position of B-axis 2
   ③ Measurement of the B-axis 2: B-axis home position +30 degrees → -30 degrees
   When the measurement is completed, the measured data appears on the screen.

   • During the measurement, the [FWD] button must be kept pressed. If the button is released during the measurement or if it is released before “O” changes into “●”, the measurement is aborted and the following message appears:

   • “Stopped measurement”
   The measurement starts again from the home position1.

3. Press [FWD].
   – Press [FWD], and the manipulator moves to the home position 2 (R-axis: rotating axis of B-axis is horizontal to the ground, B-axis: vertical to the ground).

   If the tool is interfered with during the measurement, operate the S-, L- and T-axes and move the manipulator to avoid the interference. Then move the axis to the home position 2.
8 System Setup
8.3 Tool Data Setting

   – Press [FWD] again, and measurement of T-axis starts.
   The manipulator moves in the order listed below. Once measurement is completed, “O” changes to “●”.

   - Measurement of the T-axis: T-axis home position +30 degrees → -30 degrees
   When the measurement is completed, the measured data appears on the screen.

   - During the measurement, the [FWD] button must be kept pressed. If the button is released during the measurement or if it is released before “O” changes into “●”, the measurement is aborted and the following message appears:
     • “Stopped measurement”
     The measurement starts again from the home position.

5. Select “REGISTER”. (When measuring only the tool load and the center of gravity.)
   – The measured data is registered in the tool file, and the tool coordinate window appears.
   – Select “CANCEL” to open the tool list window without registering the measured data in the tool file.
8.4 ARM Control

8.4.1 ARM Control

ARM Control, a control system originally developed by YASKAWA, achieves an enhanced robot motion performance such as improved path accuracy or reduced cycle time.

The moment of inertia and the gravity moment etc. of each axis are calculated by the ARM control function, and YRC1000micro controls robot motion according to the result. It is necessary to set the robot setup condition and the tool load information to request these accurately.

The robot setup condition is robot installation angle relative to ground and the weight and a center of gravity position of the load installed at each part of robot, etc.

The tool load information is weight, a center of gravity position, and moment of inertia at the center of gravity, of the tool installed at the flange.

It is necessary to set these information correctly to do a better operation control by the ARM control.

8.4.2 ARM CONTROL Window

---

**CAUTION**

- Correctly set the robot setup condition.
- Perform the settings of the robot setup condition with due care so that all the units and values are correct.

Failure to observe this instruction may cause improper operation control, which may result in a shortened life of the speed reducer and/or an alarm occurrence.

- Perform this setting at the time of setting up the manipulator.
  If this setting is modified at another time out of necessity, check the path of the manipulator’s operation for each job after the modification of this setting

- Perform this setting at setup the manipulator.
  If the setting is modified out of necessity, check the path of manipulator's operation for each job afterwards.

Modifying the settings of the ARM control may slightly change the path of the manipulator's operation at the execution of a job. Make sure to check the path of the manipulator's operation before executing the job. Failure to observe this instruction may cause collision between a tool and a fixture, etc., which may result in personal injury and/or equipment damage.
8.4.2.1 Robot Setup Condition

Fulfill the following robot setup condition to enable the ARM control.

- Robot installation angle
- S-head payload
- U-arm payload

**Robot installation angle**

The angle of the manipulator installed relative to ground is set in ANGLE REL. TO GROUND to calculate the gravity moment which loads to each axis of the manipulator.

The robot installation angle sets how much X axis of the robot coordinates has inclined with the ground around Y axis of the robot coordinates. The direction of + in the U axis operation from the home position posture of the manipulator becomes direction of + of the robot installation angle. Therefore, the robot installation angle for a vertical downward wall mount specification becomes -90 degrees.

<Example>

![Diagram showing robot installation angles](image)

If the robot installation angle is not correctly set, the manipulator cannot be properly controlled. Therefore, make sure to set the value correctly, paying special attentions to the direction "+" or "-".

**NOTE**

Only rotation angle around Y axis of the robot coordinates can be set in the robot installation angle. Contact YASKAWA representative when robots is installed to incline Y axis of the robot coordinates relative to ground.
S-HEAD PAYLOAD

Set the weight and the position of the gravity center of the load roughly when a device such as a transformer is installed on the S-head.

It is not necessary to set these values if no load is installed on the S-head.

- **WEIGHT (unit: kg)**
  Set the weight of the installed load.
  It is not required to set a correct value, and it is recommended to set a value slightly larger than the actual weight. (Round up the value with each fraction between 0.5 to 1 kg.)

- **X (FROM S-AXIS), Y (FROM S-AXIS) (unit: mm)**
  Set the position of the gravity center of the installed load by the distance from the S-axis center in the directions of X and Y.
  It can be set with a rough value.
  The directions of X and Y conform to the robot coordinates. When the position is in the negative direction, set a negative value.

*Fig. 8-1: Load on the S-Head (Top View)*
U-ARM PAYLOAD

Set the weight and the position of the gravity center of the load roughly when a device such as a motor for the wire feeder is installed on the U-arm.

A standard value is set at the factory.

Set "0" for the weight if no device is installed on the U-arm.

- WEIGHT (unit: kg)
  Set the weight of the installed load.
  It is not required to set a correct value, and it is recommended to set a value slightly larger than the actual weight. (Round up the value with each fraction between 0.5 to 1 kg.)

- X (FROM U-AXIS), HEIGHT (FROM U-AXIS) (unit: mm)
  Set the position of the gravity center of the installed load. It can be set with a rough value.
  X (FROM U-AXIS) is the horizontal distance from the U-axis rotation center to the position of the gravity center of the load. If the mass point is on the rear side with respect to the U-axis rotation center, set a negative value.
  HEIGHT (FROM U-AXIS) is the height in the vertical direction from the U-axis rotation center to the position of the gravity center of the load.

Fig. 8-2: Load on the U-Arm: Position of the Center of Gravity (Side View)

NOTE
The ARM CONTROL window is displayed only when the security mode is set to the management mode.
1. Select {ROBOT} under the main menu.

2. Select {ARM CONTROL}.
   - The ARM CONTROL window appears.

3. Press the page key \( \text{Page} \), or select [PAGE].
   - Select the desired control group when there are two or more group axes.

4. Select the desired item.

5. Input the value and press [ENTER].
8.4.3 Tool Load Information Setting

**WARNING**

- After modifying the tool load information, check the path of the manipulator's operation for each job which uses the corresponding tool file.

Perform the settings of the tool load information after installing the tool and before teaching a job. If the tool load information is modified at another time, check the path of the manipulator's operation for each job which uses the corresponding tool file.

Modifying the tool load information may slightly change the path of the manipulator's operation at the execution of a job. Make sure to check the path of the manipulator's operation before executing the job. Failure to observe this instruction may cause collision between a tool and a fixture, etc., which may result in personal injury and/or equipment damage.

**CAUTION**

- Correctly set the tool load information.

If the tool load information is not set correctly, the life of speed reducer may be shorter or the alarm may occur.

Failure to observe this instruction may result in a shortened life of the speed reducer and/or an alarm occurrence.

The following message appears as a reminder when the tool load information is input. "Input correct tool information. Using robot with wrong tool information may result in premature failure of the robot".
8.4.3.1 Tool Load Information

Tool load information includes weight, a center of gravity position, and moment of inertia at the center of gravity of the tool installed at the flange. These are registered in the tool file.

8.4.3.2 How to Calculate Tool Load Information

- **Weight: W (Unit: kg)**
  The total weight of the installing tool is set.
  It is not required to set a correct value, however, it is recommended to set a value slightly larger than the actual load. (Round up the value with each fraction between 0.5 to 1 kg.)

- **Center of gravity position: xg, yg, zg (Unit: mm)**
  The center of gravity position of the installed tool is set as the position in the flange coordinates.
  Since it is usually difficult to get a strict center of gravity position, it can be set with a rough value. presume and set a center of gravity position roughly from outline of the tool.
  Set the value when the center of gravity position of the installed tool is clear from specifications, etc.

- **Moment of inertia at the center of gravity: lx, ly, lz (Unit: kg·m²)**
  It is an moment of inertia of the tool at the center of gravity position.
  The value is calculated around the each axis of the coordinates which is in parallel to the flange coordinates and which home position is the center of gravity position of the tool.
  It is not required to set a correct value, however, it is recommended to set a value slightly larger than the actual value.
  This setting is used to calculate the moment of inertia which loads to each axis of the manipulator. However, the moment of inertia at the center of gravity does not need to be set when this data is small enough for the moment of inertia calculated from weight and the center of gravity position.
  However, the setting is required when the moment of inertia of the tool is large (as a rough guide, the tool is considered to be large when the tool...
size is about more than 2-times the distance between the flange and the center of gravity).

The size of the tool is not too big.
Setting the moment of inertia at center of gravity is not necessary.

The size of the tool is big.
Setting the moment of inertia at center of gravity is necessary.

Rough value of the moment of inertia at the center of gravity can be calculated by the following methods.

- Method to approximate the entire tool in hexahedron or cylinder.
- Method to calculate from each weight and center of gravity position of plural mass.

the following setting examples for details.

<Example 1>
In the example of the figure below, the center of gravity is set on the flange coordinates assuming that the center of gravity is positioned slightly inclined to the head from the center.

There is no need to set the moment of inertia at the center of gravity since the size of the tool is not too large.

<Setting>

• W : 7.000 kg
• Xg : 100.000 mm
• Yg : 0.000 mm
• Zg : 70.000 mm
• Ix : 0.000 kg •m²
• Iy : 0.000 kg •m²
• Iz : 0.000 kg •m²
8 System Setup
8.4 ARM Control

It is necessary to set the moment of inertia at the center of gravity when the entire size of the tool and workpiece is large compared to the distance from the flange to the center of gravity position.

Calculate the moment of inertia at the center of gravity roughly from the expression (the aforementioned supplement: "The own moment of inertia calculation for hexahedron and cylinder"), by approximating the entire tool in the shape of the hexahedron or the cylinder.

If the weight of held workpiece is greatly different, it is more effective to set tool load information on each workpiece and to switch the tool on each step according to the held workpiece. Set the tool load information in the state to hold the heaviest workpiece when using the tools without switching them.

Weight: \( W = 55 + 40 = 95 \)

\( \approx \) approx. 100[kg]
Center of gravity: Position at flange right under 250mm almost
(Xg, Yg, Zg) = (0,0.250)

Moment of inertia at the center of gravity:

The hexahedron of 0.500 x 0.400 x 1.000[m] which encloses the entire tool + workpiece is assumed.

By the expression to calculate the own moment of inertia of hexahedron,

\[ I_x = \left( L_y^2 + \frac{L_z^2}{12} \right) W \]
\[ = \left( (0.400^2 + 1.000^2) / 12 \right) * 100 = 9.667 \approx 10.000 \]

\[ I_y = \left( L_x^2 + \frac{L_z^2}{12} \right) W \]
\[ = \left( (0.500^2 + 0.400^2) / 12 \right) * 100 = 3.417 \approx 3.500 \]

\[ I_z = \left( L_x^2 + L_y^2 / 12 \right) W \]
\[ = \left( (0.500^2 + 1.000^2) / 12 \right) * 100 = 10.417 \approx 10.500 \]

<Setting>

- W : 100.000 kg
- Xg : 0.000 mm
- Yg : 0.000 mm
- Zg : 250.000 mm
- Ix : 10.000 kg.m²
- Iy : 3.500 kg.m²
- Iz : 10.500 kg.m²
How to calculate "Center of gravity position" and "moment of inertia at center of gravity" for plural mass

The center of gravity position and the moment of inertia at the center of gravity of the entire tool can be calculated by the weight and the center of gravity position of each mass when the tool can be thought that the tool consists of two or more big mass.

1. Divide the tool into some parts as the weight and the center of gravity position can be roughly presumed. It is not necessary to divide in detail. The tool is approximated in construction of rough parts.

2. Calculate the weight and the center of gravity position of each part on flange coordinates. It does not care by a rough value. Calculate the own moments of inertia of the big parts. (If parts are small, it is not necessary to calculate the own moments of inertia. "The own moment of inertia calculation for hexahedron and cylinder" for how to calculate the own moment of inertia.)

\[
\begin{align*}
\text{wi} & : \text{Weight of the i-th parts [kg]} \\
(xi, yi, zi) & : \text{Center of gravity position of the i-th parts} \\
& \quad \text{(On flange coordinates) [mm]} \\
Icxi, Icyi, Iczi & : \text{Own moments of inertia of the i-th parts [kg*m^2]} \\
\end{align*}
\]

3. The center of gravity position of the entire tool is calculated by the next expression.

\[
\begin{align*}
xg &= \frac{w_1 \cdot x_1 + w_2 \cdot x_2 + \ldots + w_i \cdot x_i}{w_1 + w_2 + \ldots + w_i} \\
yg &= \frac{w_1 \cdot y_1 + w_2 \cdot y_2 + \ldots + w_i \cdot y_i}{w_1 + w_2 + \ldots + w_i} \\
zg &= \frac{w_1 \cdot z_1 + w_2 \cdot z_2 + \ldots + w_i \cdot z_i}{w_1 + w_2 + \ldots + w_i}
\end{align*}
\]

4. The moment of inertia at the center of gravity position of the entire tool is calculated by the next expression.

\[
\begin{align*}
Ix &= \left( w_1 \cdot \left((y_1 - yg)^2 + (z_1 - zg)^2\right) \cdot 10^{-6} + Icxi \right) + \left( w_2 \cdot \left((y_2 - yg)^2 + (z_2 - zg)^2\right) \cdot 10^{-6} + Icxi \right) \\
& \quad \quad \quad + \left( \text{wi} \cdot \left((yi - yg)^2 + (zi - zg)^2\right) \cdot 10^{-6} + Icxi \right) \\
Iy &= \left( w_1 \cdot \left((x_1 - xg)^2 + (z_1 - zg)^2\right) \cdot 10^{-6} + Icyi \right) + \left( w_2 \cdot \left((x_2 - xg)^2 + (z_2 - zg)^2\right) \cdot 10^{-6} + Icyi \right) \\
& \quad \quad \quad + \left( \text{wi} \cdot \left((xi - xg)^2 + (zi - zg)^2\right) \cdot 10^{-6} + Icyi \right) \\
Iz &= \left( w_1 \cdot \left((x_1 - xg)^2 + (y_1 - yg)^2\right) \cdot 10^{-6} + Icz1 \right) + \left( w_2 \cdot \left((x_2 - xg)^2 + (y_2 - yg)^2\right) \cdot 10^{-6} + Icz1 \right) \\
& \quad \quad \quad + \left( \text{wi} \cdot \left((xi - xg)^2 + (yi - yg)^2\right) \cdot 10^{-6} + Icz1 \right)
\end{align*}
\]
<Example 3>

When there are two or more big mass as shown in the figure below, perform:

1. Set the center of gravity position when the center of gravity position of the entire tool is roughly understood, and set the moment of inertia at the center of gravity calculated by approximating the entire tool in the shape of hexahedron or cylinder. (It is enough in this setting usually.); or

2. When weight in each mass and the center of gravity position are understood, the center of gravity position and the moment of inertia at the center of gravity of the entire tool can be calculated. ( aforementioned supplement column: ‘How to calculate ‘Center of gravity position’ and ‘moment of inertia at the center of gravity’ for plural mass’.)

This example shows the calculation with the method 2.

![Diagram of a mechanical system with parts labeled X_F, Y_F, Z_F, X_F, Y_F, and Z_F.]

Weight of each part:
- Part 1: Weight, w1 = 3 kg
  - Center of Gravity: x1 = 100 mm, y1 = 50 mm, z1 = 40 mm
- Part 2: Weight, w2 = 6 kg
  - Center of Gravity: x2 = 100 mm, y2 = -150 mm, z2 = 70 mm

Calculations for Center of Gravity (Xg, Yg, Zg):
- Weight: W = w1 + w2 = 3 + 6 = 9 = approx. 10[kg]
- Center of gravity:
  - Xg = (w1 * x1 + w2 * x2) / (w1 + w2) = (3 * 100 + 6 * 100) / (3+6) = 100.0 [mm]
  - Yg = (3 * 50 + 6 * (-150)) / (3+6) = -83.333 [mm]
  - Zg = (3 * 40 + 6 * 70) / (3+6) = 60.0 [mm]

Calculations for Moment of Inertia (Ix, Iy, Iz):
- The moment of inertia at the center of gravity position:
  - Ix = \{w1 * ((y1 - Yg)^2 + (z1 - Zg)^2) * 10^{-6} + Icx1\} + \{w2 * ((y2 - Yg)^2 + (z2 - Zg)^2) * 10^{-6} + Icx2\}
  = 3 * ((50 - (-83))^2 + (40 - 60)^2) * 10^{-6} + 6 * ((-150) - (-83))^2 + (70 - 60)^2) * 10^{-6}
  = 0.082 = approx. 0.100
  - Iy = 3 * ((100 - 100)^2 + (40 - 60)^2) * 10^{-6} + 6 * ((100 - 100)^2 + (70 - 60)^2) * 10^{-6}
  = 0.002 = approx. 0.010
  - Iz = 3 * ((100 - 100)^2 + (50 - (-83))^2) * 10^{-6} + 6 * ((100 - 100)^2 + ((-150) - (-83))^2) * 10^{-6}
  = 0.080 = approx. 0.100

* The own moment of inertia (Icx, Icy, Icz) of the tool is disregarded in this example, since each tool is smaller than the entire tool.
8.4.3.3 Tool Load Information Registering

Tool load information is registered in the tool file.

1. Select {ROBOT} under the main menu.

2. Select (TOOL).
   - The tool coordinate list window appears.
   - The tool coordinate list window appears only when TOOL NO. SWITCH in the TEACHING CONDITION window is set to PERMIT.
   - When TOOL NO. SWITCH in the TEACHING CONDITION window is set to PROHIBIT, the tool window appears.

<table>
<thead>
<tr>
<th>W</th>
<th>10.000 kg</th>
</tr>
</thead>
<tbody>
<tr>
<td>Xg</td>
<td>100.000 mm</td>
</tr>
<tr>
<td>Yg</td>
<td>-83.333 mm</td>
</tr>
<tr>
<td>Zg</td>
<td>60.000 mm</td>
</tr>
<tr>
<td>Ix</td>
<td>0.100 kg.m^2</td>
</tr>
<tr>
<td>Iy</td>
<td>0.010 kg.m^2</td>
</tr>
<tr>
<td>Iz</td>
<td>0.100 kg.m^2</td>
</tr>
</tbody>
</table>
3. Select the desired tool number.
   (1) Move the cursor to the number of the desired tool, and press [SELECT] in the tool list window.
   (2) The tool coordinate window of the selected number appears.
   (3) Select the desired number in the tool coordinate window by pressing the [PAGE] or clicking on the [PAGE] button.
   (4) To switch the tool list window and the tool coordinate window, press (DISPLAY) → (LIST) or (DISPLAY) → (COORDINATE DATA).

4. Select the desired item to register and input the value.
   – The window can be scrolled with the cursor.
   – The menu enters the state of a numeric input if the cursor is on the desired item to register and the [SELECT] is pressed.

5. Press [ENTER].
   – The input value is registered.
   – The servo power is automatically turned OFF when editing the value while the servo power is ON, followed by a message “Servo off by changing data” displayed for three seconds.
• When the data setting is not done

It is considered that data is not set correctly in tool load information in the following cases.

• When the weight (W) is “0”.
• When the center of gravity position (Xg, Yg, Zg) are all “0”.

In these cases, the manipulator is controlled by the initial setting values (vary according to each robot model) which were set to the parameter before shipping.

Initial Setting Value:

Weight: W = Payload
Center of gravity position: (Xg, Yg, Zg) =
(0, 0, Allowed value of B-axis for payload)

In this case, when an actual tool load is not large enough, the manipulator cannot sufficiently exert its function, (speed and acceleration / deceleration). Especially, when operating the manipulator with the initial setting value, a difference of 100 kg or more in the load between the actual tool load and the initial setting value may cause vibrations in the manipulator motion: it is therefore essential to correctly set the tool load information for the proper operation of the manipulator.

Moreover, when the tool which an actual tool center of gravity position greatly offsets in X-direction or Y-direction is installed the generated moment by the tool cannot be compensated.

To set the tool load information correctly, following message appears when the playback operation is executed by using the initial setting value.

"Using robot without setting tool info. may result in premature failure of the robot. Set W, Xg, Yg, and Zg in the tool file."

• Switch of the tool file

In case that two or more tool files are used, information on an effective tool file is referred for tool load information used by the ARM control at that time in according to switch tool file.

Set the same value of tool load information in each tool file when the tool file is switched to change only TCP (when neither the weight nor the center of gravity position of the entire tool installed in the flange is changed).

Moreover, set tool load information to the corresponding tool file respectively when total weight and the center of gravity position etc. of the tool is changed (when the system which exchange the tool by automatic tool changer).
8.5 Work Home Position

8.5.1 What is the Work Home Position?

The Work Home Position is a reference point for manipulator operations. It prevents interference with peripheral device by ensuring that the manipulator is always within a set range as a precondition for operations such as starting the line. The manipulator can be moved to the set work home position by operation from the programming pendant, or by signal input from an external device. When the manipulator is in the vicinity of the work home position, the work home position signal turns ON.

8.5.2 Setting Work Home Position

8.5.2.1 Work Home Position Window

1. Select (ROBOT) under the main menu.

2. Select (WORK HOME POS).
   - The WORK HOME POSITION window is appears.
3. Press the [PAGE].

   – When two or more manipulators exist in the system, use the [PAGE] to change the control group, or click on [PAGE] to select the desired control group.

![Diagram showing work home position data]
8.5.2.2 Registering/Changing the Work Home Position

1. Press the axis keys in the work home position display.
   - Move the manipulator to the new work home position.

2. Press [MODIFY], [ENTER].
   - New work home position is set.

When the work home position is changed, the cubic interference area is automatically set as cube 64 to 63 in the base coordinate system.

- The cube 64 is for ROBOT1
- The cube 63 is for ROBOT2

The work home position cube is a cube as shown in fig. 8-3 “S3C1097: The work home position cube length of its sides (µm)”; the length of its sides (a in fig. 8-3) is determined by a parameter of S3C1097 (units: µm).

By changing the contents of this parameter, the size of the cube can be changed. (The initial value is 10cm)

Fig. 8-3: S3C1097: The work home position cube length of its sides (µm)

Specify whether “COMMAND POSITION” or “FEEDBACK POSITION” is to be set to the work home position cube signal’s CHECK MEASURE in the interference area settings. “COMMAND POSITION” is the default setting.

For the INTERFERENCE AREA window, refer to chapter 8.6 “Interference Area”.

8-62
8. System Setup
8.5 Work Home Position

8.5.2.3 Returning to the Work Home Position

- **In the teach mode**
  1. Press [FWD] in the work home position display.
     - The manipulator moves to the new work home position. The moving speed is the selected manual speed.

- **In the play mode**
  When the work home position return signal is input (detected at leading edge), the TCP of the manipulator is moved to the work home position. When the manipulator moves, a message “Operation origin returning” is displayed. In this case, the move interpolation is MOVJ, and the speed applied is the one set in the parameters. (S1CxG56; units: 0.01%).

8.5.2.4 Output of the Work Home Position Signal

This signal is output any time the current position of the TCP of the manipulator is checked and found to be within the work home position cube.
8.6 Interference Area

8.6.1 Interference Area

The interference area is a function that prevents interference between multiple manipulators or the manipulator and peripheral device. The areas can be set up to 64 areas. Three types of methods to use each interference area are as follows:

- Cubic Interference
- Outside of cubic area
- Axis Interference

The YRC1000micro judges whether the TCP of the manipulator is inside or outside this area, and outputs this status as a signal.

8.6.2 Cubic Interference Area

8.6.2.1 Cubic Interference Area

This area is a rectangular parallelepiped which is parallel to the base coordinate, robot coordinate, or user coordinate. The YRC1000micro judges whether the current position of the manipulator’s TCP is inside or outside this area, and outputs this status as a signal.
8 System Setup
8.6 Interference Area

- **Types of Cubic Interference Area**
  Two types of method to use the cubic interference area are as follows.
  - **Cubic Interference**
    Inside the specified cube is defined as the interference area.
    When the current position of manipulator's TCP is located inside the cube, the corresponding specific output signal is ON.
  - **Outside of cubic area**
    Outside the specified cube is defined as the interference area.
    When the current position of manipulator's TCP is located outside the cube, the corresponding specific output signal is ON.
8.6.2.2 Cube Setting Method

There are three ways to set cubic a interference area as described in the following sections:

1. Enter the maximum and minimum values for the cube coordinates.

2. Move the manipulator at the maximum and minimum value positions of the cube corner using the axis keys.

3. After entering the lengths of the three faces of the cube (axial length) using the Numeric keys, move the manipulator to the center point of the cube using the axis keys.
8 System Setup
8.6 Interference Area

8.6.2.3 Setting Operation

1. Select {ROBOT} under the main menu.

2. Select {INTERFERENCE}.
   - The INTERFERENCE AREA window is shown.
3. Select the desired cube number.
   - Select the desired cube number with the [PAGE] or by number input.
   - When selecting the cube number by number input, select [PAGE] to input the desired signal number.

4. Select “METHOD”.
   - A selection dialog box appears.
   (1) Select “CUBIC INTERFERENCE” or “OUTSIDE OF CUBIC AREA”.

![Diagram of the selection dialog box for system setup]

![Another diagram of the selection dialog box for interference area]

8-68
5. Select “CONTROL GROUP”.
   – A selection dialog box appears.
   (1) Select the desired control group.

6. Select “REF COORDINATES”.
   – A selection box appears.
   (1) Select the desired coordinate.
   (2) If the user coordinates are selected, the number input line is displayed. Input the user coordinate number and press [ENTER].
7. Select “CHECK MEASURE”.

– Each time [SELECT] is pressed, “COMMAND POSITION” and “FEEDBACK POSITION” are displayed alternately.

– “COMMAND POSITION” : When the command position (which is displayed on the current position window) is in the interference area, the signal is turned ON.

– “FEEDBACK POSITION” : When the actual position of the manipulator is in the interference area, the signal is turned ON.

NOTE
To stop the manipulator movement using the interference signal (use the cube interference signal for mutual interference between robots), set CHECK MEASURE to “COMMAND POSITION”.

When set to the “FEEDBACK POSITION”, the manipulator decelerates to a stop after entering the interference area.

When using the interference signal to inform an external unit of the actual manipulator position, use the “FEEDBACK POSITION” setting to enable the signal output in more accurate timing.
8. Select "ALARM OUTPUT".

- Each time [SELECT] is pressed, “OFF” and “ON” are displayed alternately.

When selecting “ON” and if the manipulator’s TCP approaches inside the pre-defined interference area, the following alarm occurs and the manipulator stops immediately.

AL4902 CUBE INTERFERENCE (TCP)
8 System Setup
8.6 Interference Area

- **Number Input of the Cube Coordinates**
  1. Select “METHOD”.
     
     (1) Each time [SELECT] is pressed, “MAX/MIN” and “CENTER POS” switch alternately.
     
     (2) Select “MAX/MIN”.

     ![Image of Interference Area Settings]

     2. Input number for “MAX” and “MIN” data and press [ENTER].

     – The cubic interference area is set.

     ![Image of Interference Area Settings after input]
Teaching Corner

1. Select “METHOD”.
   
   (1) Each time [SELECT] is pressed, “MAX/MIN” and “CENTER POS” switch alternately.
   
   (2) Select “MAX/MIN”.

2. Press [MODIFY].
   
   – A message “Teach max./min. position” appears.

3. Move the cursor to “<MAX>” or “<MIN>”.
   
   – Move the cursor to “<MAX>” when changing the maximum value, and move cursor to “<MIN>” when changing the minimum value. The cursor only moves to either “<MIN>” or “<MAX>” at this time.

4. Move the manipulator using the axis keys.
   
   – Move the manipulator to the maximum or minimum position of the cube using the axis keys.
5. Press [ENTER].

- The cubic interference area is registered.
Number Input of the Side of Cube and Teaching Center

1. Select “METHOD”.
   (1) Each time [SELECT] is pressed, “MAX/MIN” and “CENTER POS” switch alternately.
   (2) Select “CENTER POS”.

2. Input data for length of the cube, then press [ENTER].
   – The length is set.
3. Press [MODIFY].
   – A message "Move to center point and teach" appears. The cursor only moves to either "<MIN>" or "<MAX>" at this time.

4. Move the manipulator using the axis keys.
   – Move the manipulator to the center point of the cube using the axis keys.

5. Press [ENTER].
   – The current position is registered as the center point of the cube.
8.6 Interference Area

8.6.3 Axis Interference Area

8.6.3.1 Axis Interference Area

The axis interference area is a function that judges the current position of each axis and outputs a signal. Once the maximum and minimum values have been set at the plus and minus sides of the axis to define the working range, a signal indicating whether the current position of the axis is inside or outside this range is output. (ON: inside, OFF: outside)

Fig. 8-4: Axis Interference Signal for Station Axis

8.6.3.2 Setting Operation

1. Select {ROBOT} under the main menu.
2. Select {INTERFERENCE}.

   – The INTERFERENCE AREA window appears.
3. Select the desired interference signal number.
   - Select the desired interference signal number using the [PAGE] or by number input.
   - When selecting the desired interference signal number by number input, select [PAGE] to input the desired signal number.

4. Select “METHOD”.
   - A selection dialog box appears.
   (1) Select “AXIS INTERFERENCE”.
5. Select “CONTROL GROUP”.
   – A selection box appears. Select the desired control group.

6. Select “CHECK MEASURE”.
   – Each time [SELECT] is pressed, “COMMAND POSITION” and “FEEDBACK POSITION” switch alternately.
7. Select “ALARM OUTPUT”.

– Each time [SELECT] is pressed, “OFF” and “ON” are displayed alternately.

When selecting “ON” and if the manipulator’s axes approach inside the pre-defined interference area, the following alarm occurs and the manipulator stops immediately.

AL4901 AXIS INTERFERENCE

   (1) Each time [SELECT] is pressed, “MAX/MIN” and “CENTER POS” switch alternately.

   (2) Select “MAX/MIN”.

2. Input number for “MAX” and “MIN” data and press [ENTER].

   - The axis interference area is set.
Teaching Corner

1. Select "METHOD".
   
   (1) Each time [SELECT] is pressed, "MAX/MIN" and "CENTER POS" switch alternately.

   (2) Select "MAX/MIN".

2. Press [MODIFY].
   
   – A message "Teach max./min. position" appears.

3. Move the cursor to "<MAX>" or "<MIN>".
   
   – Move the cursor to "<MAX>" when changing the maximum value, and move cursor to "<MIN>" when changing the minimum value. The cursor only moves to either "<MIN>" or "<MAX>" at this time.

4. Move the manipulator using the axis keys.
   
   – Move the manipulator to the maximum or minimum position of the cube using the axis keys.
5. Press [ENTER].

– The cubic interference area is registered.
### Number Input of Center Position (WIDTH) and Teaching Center

1. Select “METHOD”.
   
   (1) Each time [SELECT] is pressed, “MAX/MIN” and “CENTER POS” switch alternately.
   
   (2) Select “CENTER POS”.

2. Input number for “WIDTH” data and press [ENTER].
   
   – “WIDTH” is set.
3. Press [MODIFY].
   - A message "Move to the center point and teach" appears. The cursor only moves to either "<MIN>" or "<MAX>" at this time.

4. Move the manipulator using the axis keys.
   - Move the manipulator to the center position of the cube using the axis keys.

5. Press [ENTER].
   - The center position of the cube is registered.
8.6.4 Clearing the Interference Area Data

1. Select (ROBOT) under the main menu.

2. Select (INTERFERENCE).

   – The INTERFERENCE AREA window is shown.

3. Select interference signal to be cleared.

   – Select the desired interference signal number to be cleared using the [PAGE] or by number input.

   – When selecting the desired interference signal number by number input, select [PAGE] to input the desired signal number.

4. Select (DATA) in the pull-down menu.
5. Select {CLEAR DATA}.
   – The confirmation dialog box appears.

6. Select {YES}.
   – All the data of the interference signal number are cleared.
8.7 Shock Detection Function

8.7.1 Shock Detection Function

The shock detection function is a function to decrease damage due to the collision by stopping the manipulator without any external sensor when the tool or the manipulator collide with peripheral device.

When the shock is detected either in teach mode or in play mode, the manipulator is stopped immediately.

### WARNING

The shock detection function does not completely prevent damage to the peripheral devices or guarantee human safety. Make sure to take safety measures such as installing safety fences. For details on safety measures, refer to chapter 1 “Safety” to chapter 6 “Test of Program Operation” for the safety measures in details.

Failure to observe this instruction may cause contact with the manipulator, which may result in personal injury and/or equipment damage.

8.7.2 Shock Detection Function Setting

At the factory default setting, the threshold value is set to detect a collision without a miss even when the manipulator is operating at the maximum speed, on the assumption that the tool file is correctly set. To detect a collision during normal operation, check the following points:

- The tool’s load and moment do not exceed the rated values.
- The actual tool load and the tool file setting value are the same.
- The U-arm payload information and the set weight of U-arm payload in the ARM CONTROL window are the same.

In addition, detection sensitivity can be decreased for only a specific section where a contact task is performed.

The detection sensitivity is set by setting the detection level.

8.7.2.1 Shock Detection Level Setting

The shock detection level is set in the shock detection level set file.

The shock detection level set file are nine condition files as following figure.

- Condition numbers 1 to 7 are used when the detection level is changed in a specific section in play mode.
- Condition number 8 is used as standard in play mode: this function is operated by the detection level set in this file during playback operation.
- Condition number 9 is for teach mode: the shock detection function applies the detection level set here when the manipulator is operated in teach mode.
- Condition numbers 1 to 8 are set for each axis and condition 9 is set for each group.
The detection level is changed by a job instruction SHCKSET.

- After the instruction is executed, the shock will be detected by the specified detection level when the condition number is specified with the SHCKSET instruction.
- The detection level is returned to standard level when the SHCKRST instruction is executed.

**Teach Mode Each Axis Setting Function**

Usually, the detection level setting of teach mode is set for each group.

By using this function, the detection level can be set for each axis.

S2C869: Teach Mode Each Axis Setting Function

(1: VALID, 0: INVALID)
8.7 Shock Detection Function

1 **Condition Number (1 to 9)**
   1 to 7: for changing detection level in play mode.
   8: for standard detection level in play mode.
   9: for detection level in teach mode.

2 **Robot Select**
   Select the manipulator whose detection level is to be changed.

3 **Function Select**
   Specifies VALID/INVALID of the shock detection function. The shock detection function is specified for each manipulator.
   1. Select the manipulator whose function is to be enabled or disabled.
   2. Move the cursor to “VALID” or “INVALID” and press [SELECT]. Each time [SELECT] is pressed, “INVALID” and “VALID” are displayed alternately. The change is available for all the condition numbers.

4 **Max. Disturbance Force**
   Indicates the maximum disturbance force to the manipulator when the manipulator is moved in play back operation or axis operation.
   this value when inputting the detection level value in 5.
   The maximum disturbance force can be cleared by selecting (DATA) \(\rightarrow\) (CLEAR MAX VALUE) in the menu.

5 **Detection Level (Level range: 1 to 500)**
   Specifies the shock detection level. Set a value larger than the maximum disturbance force.
   The value set by default (the level 100) enables the function without false detection even if the manipulator is operated at the maximum speed.
   To change DETECT LEVEL, move the cursor to the subject manipulator, and press [SELECT] to display the numeric input status; input the value with a numeric key and press [ENTER]. To increase the detection sensitivity, set the level to small value, and to decrease the sensitivity, set the level to large value.
8 System Setup
8.7 Shock Detection Function

**Method of Shock Detection Level File Setting**

1. Select {ROBOT} under the main menu.

2. Select {SHOCK SENS LEVEL}.
   - The EACH AXIS LEVEL window appears.
   - Perform either of the following operations to display the page of desired condition number:
     1. Press [PAGE] in the window. Enter the desired condition number using numeric keys and press [ENTER]. Then the page of the condition number appears.
     2. Press the [PAGE] to change the condition number.

3. Level setting for the condition numbers 1 to 8.
   Level setting values can be set for each axis on the EACH AXIS LEVEL window.
   Perform the following “Disturbance force measurement”, then perform “Setting all levels at once”.

**Disturbance force measurement**

1. Mount the tool, workpiece, external equipment, and equipment on the arm to the manipulator.

2. Set the tool file correctly.
   For material handling: Set the total load information (weight, center of gravity, and the moment of inertia at the center of gravity) of the hand and the maximum load workpiece.
   For other applications: Set the load information (weight, center of gravity, and the moment of inertia at the center of gravity) of the tool.

3. Set the detection level values of all the axes to 100.
   1. Open the SHOCK DETECT LEVEL window.
   2. Select {DATA}, then {CLEAR MAX VALUE}.

4. Perform the JOB.

**Setting all levels at once**

1. Open the SHOCK DETECT LEVEL window.

2. Select {DATA}, then {CHANGE EVERY LEVEL}.

3. Enter 120 in the coefficient (%) by which the max. disturbance force is multiplied.
   The following calculated value A or B, whichever is larger, is set to the DETECT LEVEL.
   A: (Max. disturbance force) x (coefficient = 120%)  
   B: (Max. disturbance force) + 15

   <Example>
   When the max. disturbance force is 80, the DETECT LEVEL is 96.  
   When the max. disturbance force is 10, the DETECT LEVEL is 25.

4. Level setting for the condition number 9.
   The level setting for the condition number 9 is for the teach mode.
This setting is made for each group. the max. disturbance force to set the DETECT LEVEL.

**NOTE**
- Perform all the jobs to use for 5 to 6 hours.
- If a work job is performed both with holding a workpiece and without holding a workpiece, measure both patterns.
- In the event of a collision while measuring the max. disturbance force, clear the max. disturbance force by selecting (DATA), then (CLEAR MAX VALUE). Then try again.
- The max. disturbance force is cleared when the power is turned ON/OFF. Therefore, DO NOT set the level based on the max. disturbance force immediately after turning ON/OFF the power.
- When the teaching point, operation speed, operation position, etc. of a job are greatly changed due to teaching modification, etc., measure the max. disturbance force and set the DETECT LEVEL again.
- When the load of tool or workpiece is greatly modified, measure the max. disturbance force and set the DETECT LEVEL again.

**NOTE**
To avoid false detection during manipulator operation, set the following calculated value A or B, whichever is larger, to the DETECT LEVEL. An emergency stop of the manipulator due to the false detection may become a factor to damage the speed reducers and tools.

A: (Max. disturbance force) x (coefficient = 120%)  
B: (Max. disturbance force) + 15

**Example**
When the max. disturbance force is 80, set the DETECT LEVEL to 96 or more.  
When the max. disturbance force is 10, set the DETECT LEVEL to 25 or more.
To adjust to the change in the grease viscosity at a cold start, the offset value is automatically added to DETECT LEVEL until the robot has operated for a certain period of time.

Thus, at a cold start, the shock detection will be performed only when the value is more than or equal to the sum of DETECT LEVEL and the offset value. The offset value varies depending on the manipulator type.

**NOTE**

DETECT LEVEL can be modified only when the security mode is set in the management mode.
8.7.2.2 EACH AXIS LEVEL (CURRENT) Window

Able to confirm the current detection level.

1. **Robot Select**
   Select the manipulator to display the detection level.

2. **Function Select**
   Displays the valid/invalid status of the shock detection function.

3. **Max. Disturbance Force**
   Indicates the maximum disturbance force to the manipulator when the manipulator is moved in play back operation or axis operation. The maximum disturbance force can be cleared by selecting (DATA) \(\rightarrow\) (CLEAR MAX VALUE) in the menu.

4. **Detection Level**
   Displays the shock detection level. When the maximum disturbance force exceeds this set value, the shock is detected.

**NOTE**
To adjust to the change in the grease viscosity at a cold start, the offset value is automatically added to DETECT LEVEL until the robot has operated for a certain period of time. Thus, at a cold start, the shock detection will be performed only when the value is more than or equal to the sum of DETECT LEVEL and the offset value. The offset value varies depending on the manipulator type.

8.7.2.3 Tool Load Information Setting

To increase the accuracy of shock detection, set the tool load information in the tool file. Refer to chapter 8.4.3 “Tool Load Information Setting” for details of the tool load information setting.

8.7.2.4 U-Arm Payload Setting

To perform shock detection more accurately, set the U-arm payload. See chapter 8.4.2 “ARM CONTROL Window” for details of the U-arm payload setting.
8 System Setup
8.7 Shock Detection Function

8.7.2.5 Instruction of Shock Detection Function

- **SHCKSET instruction**
  The SHCKSET instruction changes the shock detection level to the value set in the shock detection level file during play back operation.
  The additional items of the SHCKSET instruction are as follows.

```
SHCKSET R1 SSL#(1) AXIS1=100 AXIS2=100 AXIS3=100 AXIS4=100
       AXIS5=100 AXIS6=100 AXIS7=100 AXIS8=100
```

1. **Robot Setting**
   Specifies the manipulator (R1 to R2)/ station (ST1 to ST3) of which shock detection level is to be modified.
   If nothing is specified, the modification is applied to the shock detection level of the job control group in this instruction.
   However, in case of coordinated job, the modification is applied to the shock detection level of the slave axis group.

2. **Shock Detection Level Condition Number (1 to 7)**
   Specifies the shock detection level condition number in which the detection level in playback mode is set.

3. **Changing the Shock Detection Level for Each Axis**
   *(Setting range: 1 to 500)*
   Change the shock detection level specified in the changing the shock detection level for the each axis.
   If the shock detection level is not specified, the level will be the detection level specified in the shock detection level condition number.
   As for the manipulator with six axes, each axis indicates as follows.

```
<table>
<thead>
<tr>
<th>AXIS1</th>
<th>AXIS2</th>
<th>AXIS3</th>
<th>AXIS4</th>
<th>AXIS5</th>
<th>AXIS6</th>
</tr>
</thead>
<tbody>
<tr>
<td>↓</td>
<td>↓</td>
<td>↓</td>
<td>↓</td>
<td>↓</td>
<td>↓</td>
</tr>
<tr>
<td>S-axis</td>
<td>L-axis</td>
<td>U-axis</td>
<td>R-axis</td>
<td>B-axis</td>
<td>T-axis</td>
</tr>
</tbody>
</table>
```

If the non-existing axis in the system was specified to change the shock detection level for each axis, the its specified shock detection level is invalid.
8 System Setup
8.7 Shock Detection Function

■ SHCKRST instruction
The shock detection level changed by the SHCKSET instruction is reset and returned to the detection level of the standard (value set in condition number 8) by the SHCKRST instruction.

The additional item of the SHCKRST instruction is as follows.

```
SHCKRST R1
```

1 Robot Setting
Specifies the manipulator (R1 to R2)/ station (ST1 to ST3) of which shock detection level is to be modified.

- If nothing is specified, the modification will be applied to the shock detection level of the job control group of this instruction.
- However, in case of coordinated job, the modification is applied to the shock detection level of the slave axis group.

■ Instruction Registration
The instruction is registered when the cursor is in the address area in the JOB CONTENT window in teach mode.

1. Select {JOB} under the main menu.

2. Select {JOB}.

3. Move the cursor in the address area.

■ SHCKSET
1. Move the cursor to the immediately preceding line where the SHCKSET instruction is to be registered.

2. Press [INFORM LIST].
   - The inform list dialog box is shown.
3. Select SHCKSET instruction.

   (1) SHCKSET instruction is shown in the input buffer line.

   ![Image of SHCKSET instruction]

   (2) Change the value of additional item and numerical data.

   (3) Press [INSERT] then [ENTER].

4. Change the value of additional item and numerical data.

   - < When registering the instruction as it is >
     Operate the step 5 when registering the instruction in the input buffer line as it is.

   - < When adding or changing the additional item >
     • When changing the shock detection level

       (1) When changing the shock detection level, move the cursor to the shock detection level condition number; hold down [SHIFT] and press the up/down cursor key to change the condition number.

       ![Image of SHCKSET instruction with condition number]

       • When the value is input with the numeric key

       (1) When the value is input with the numeric key, press [SELECT] to display the input buffer line.

       ![Image of input buffer line]

       (2) Press [ENTER] to change the number in the input buffer line.

       • When the robot specification is added

       (1) When the robot specification is added, move the cursor to the instruction in the input buffer line and press [SELECT] to display the DETAIL window.

       ![Image of DETAIL window]

       (2) Move the cursor to “UNUSED” of “ROBOT/STATION”, and press [SELECT].

       (3) The selection box appears.

8-97
8 System Setup
8.7 Shock Detection Function

(4) Point the cursor to the robot/station to be added and press [SELECT].

(5) When the addition of robot/station is completed, press [ENTER].

(6) The DETAIL window closes and the JOB CONTENT window appears.

• When the shock detection level for each axis change is added

(1) Move the cursor over the instruction in the input buffer line, and select [Select] to display the DETAIL EDIT window.
8 System Setup
8.7 Shock Detection Function

(2) Move the cursor to “UNUSED” of any “SENS(AXIS)” to change the detection level, and press [SELECT].

(3) The selection box appears, and select “AXIS=“.

(4) Press [ENTER] after adding the items.

(5) The JOB CONTENT window appears, after closing the DETAIL EDIT window.

- When changing the shock detection level for each axis
  (1) When changing the shock detection level for the each axis, move the cursor to the shock detection level; hold down [SHIFT] and press the up/down cursor key to change the level.

- When the value is input with the numeric key
  (1) When the value is input with the numeric key, press [SELECT] to display the input buffer line.

  (2) Input the numbers, and then press [ENTER]. The value in the input buffers is changed.

5. Press [INSERT] then [ENTER].
   – The instruction displayed in the input buffer line is registered.
8 System Setup
8.7 Shock Detection Function

**SHCKRST**

1. Move the cursor to the immediately preceding line where the SHCKRST instruction is to be registered.

2. Press [INFORM LIST].
   - The inform list appears.

3. Select SHCKRST instruction.
   - SHCKRST instruction appears in the input buffer line.

4. Change the value of the additional item.
   - < When registering the instruction as it is >
     Operate the step 5 when registering the instruction in the input buffer line as it is.
   - < When adding or changing the additional item >
     (1) When adding the robot specification, move the cursor to instruction in the input buffer line and press [SELECT] to display the DETAIL window.

     ![DETAIL window](image)

     (2) Move the cursor to “UNUSED” of “ROBOT/STATION”, and press [SELECT].

8-100
(3) The selection box appears.

(4) Point the cursor to the robot to be added and press [SELECT].

![Screenshot of a window with robot selection options]

(5) When the addition of robot is completed, press [ENTER].

(6) The DETAIL window closes and the JOB CONTENT window appears.

5. Press [INSERT] then [ENTER].
   – The instruction displayed in the input buffer line is registered.
8.7.2.6 Resetting the Shock Detected

When the collision of tool/manipulator and peripheral device is detected with the shock detection function, the manipulator stops instantaneously with alarm output. In this case, the shock detection alarm is displayed.

1. Press [SELECT].
   - The alarm is reset when “RESET” is selected on the alarm display, and the shock detection status is released.

2. Operation after resetting the detection status.
   - In teach mode, the JOG operation of the manipulator is enabled by resetting the status.
   - In the play mode, move the manipulator once to the safety position in the teach mode to check the damage though the playback operation is possible after resetting the status.

**NOTE**

When manipulator is stopped instantaneously while having contact with the object and the detection alarm is tried to reset on the alarm window, the situation in which the alarm cannot be reset may occur since the collision may be detected again after resetting.

In this case, set the shock detection function “INVALID”, or increase the detection level in teach mode and retreat the manipulator to a safety position.
8.8 User Coordinates Setting

8.8.1 User Coordinates

8.8.1.1 Methods for User Coordinates Setting

There are two methods for user coordinates setting as following.

- Perform teaching by axis operations of the manipulator
  User coordinates are defined by three points that have been taught to the manipulator through axis operations. These three defining points are ORG, XX, and XY, as shown in the diagram below. These three points of positional data are registered in a user coordinate file.

  ![User coordinate definition point diagram]

  ORG is the home position, and XX is a point on the X-axis. XY is a point on the Y-axis side of the user coordinates that has been taught, and the directions of Y- and Z-axes are determined by point XY.

  NOTE
  It is important that the two points ORG and XX be taught accurately.

- Specify the amount of change from the basic coordinates
  User coordinates are defined by specifying the coordinates as a basic coordinates (base coordinates or user coordinates) and the amount of change of coordinate value from the basic coordinates. As shown in the following figure, the data X, Y, Z, Rx, Ry, Rz indicate the amount of change of coordinate value. These six data is registered in the user coordinates file.

  ![Specify the amount of change diagram]

  X,Y,Z are the amount of movement with respect to the basic coordinates. Rx, Ry, Rz are the rotation angle with respect to the basic coordinates.
User Coordinates Files

Up to 63 kinds of user coordinates can be registered. Each coordinate has a user coordinate No. and is called a user coordinate file.
8.8.2 User Coordinate Setting

1. Select {ROBOT} under the main menu.
2. Select {USER COORDINATE}.

(1) The USER COORDINATE window appears.

(2) The “●” mark indicates that the user coordinates is completed to set and the “O” mark indicates that it is not completed.

(3) To check the position of the user coordinates select {DISPLAY} → {COORDINATE DATA}.

(4) The following window appears.
8 System Setup
8.8 User Coordinates Setting

- Perform teaching by axis operations of the manipulator
  1. Move the cursor to the user coordinate number to be set.

2. Press [SELECT].
   - The user coordinate setup window is shown.

3. Select the robot.
   - Select "**" on the upper left of the window to select the subject robot.
   (This operation can be omitted if the robot selection has already been made or if there is only one robot.)
4. Select “SET POS”.
   - Select the teaching point.

4. Select “SET POS”.
   - Select the teaching point.

5. Move the manipulator to the desired position with the axis keys.

6. Press [MODIFY] then [ENTER].
   - Taught position is registered.
   - Repeat the steps 2 to 4 to teach ORG, XX and XY.
   - “●” indicates that teaching is completed and “O” indicates that it is not completed.

5. Move the manipulator to the desired position with the axis keys.

6. Press [MODIFY] then [ENTER].
   - Taught position is registered.
   - Repeat the steps 2 to 4 to teach ORG, XX and XY.
   - “●” indicates that teaching is completed and “O” indicates that it is not completed.

   - To check the taught positions, call up the required window among ORG to XY and press [FWD]. The manipulator moves to the set position.
   - If there is a difference between the current position of the manipulator and the displayed position data, “ORG”, “XX”, or “XY” flashes.
7. Select (COMPLETE).

- User coordinates are registered in the file.
- Once the user coordinate setting is completed, the following window appears.
Specify the amount of change from the basic coordinate

1. Move the cursor to the user coordinate number to be set.

2. Select {DISPLAY} of the main menu.
   - The pull-down menu is shown.

3. Select {COORDINATE VALUE}.
4. Select “ROBOT”.
   – Select the target robot.

5. Select “BASIC COORDINATE”.
   – Select the base coordinate/user coordinate for the basic coordinate.

NOTE
The user coordinates number which is not yet registered or currently selected cannot be selected. Also, the user coordinates number which uses another user coordinates as the basic coordinates cannot be selected.
8 System Setup

8.8 User Coordinates Setting

– When the user coordinate is selected for the basic coordinate, 
   "(●:REGISTERED STATUS)" or "(○:UNREGISTERED STATUS)" is shown. ● indicates the user coordinates number which is fully registered. ○ indicates the user coordinates number which is not yet registered.

6. Select the item to be set and input the number.
– Input the amount of change from the basic coordinate.

NOTE
If the user coordinates which specify another user coordinates number in unregistered status as the basic coordinates are used, the alarm no.4508 “SPECIFIED ERROR(COORDINATE) [18]" occurs.
To select the user coordinates for the basic coordinates, specify the registered user coordinates number as the basic coordinates.
7. Select (REFLECT).

- The user coordinate is created and registered in the user coordinate file.
8.8.3 Clearing the User Coordinates

1. Select (DATA) under the pull-down menu.

2. Select (CLEAR DATA).
   - The confirmation dialog box appears.

3. Select (YES).
   - All data is cleared.
8.9 Overrun/Tool Shock Sensor Releasing

If the manipulator stops by overrun detection or tool shock sensor detection, release the overrun or tool shock sensor by the following procedure and reset the alarm and move the manipulator with the axis keys.

1. Select {ROBOT} under the main menu.
2. Select {OVERRUN & S-SENSOR}.
   - The OVERRUN & SHOCK SENSOR window appears.
   - Select either “EMERGENCY STOP” or “HOLD” to set the item “SHOCK SENSOR STOP COMMAND” which specifies the stop condition in the current shock sensor detection.
   - “E-STOP” and “HOLD” are displayed alternately every time [SELECT] is pressed.

CAUTION

When operating the manipulator with the overrun or shock sensor released, pay careful attention to ensure the safety of the surrounding operation environment.
3. Select “RELEASE”.
   – The control group in which overrun or shock sensor is detected is indicated with “●”.
   – If “RELEASE” is selected, overrun or tool shock sensor is released and “CANCEL” indication will be displayed.

4. Select “ALM RST”.
   – The alarm is reset and manipulator can be moved with the axis keys.

   **NOTE**
   After releasing the overrun or tool shock sensor, if “CANCEL” is selected or the window is changed to the other one, the release of the overrun or tool shock sensor will be canceled.
8.10 Soft Limit Release Function

The switches that are set to detect the motion range of the manipulator are called limit switches. The operating range is monitored by the software in order to stop motion before these limit switches are reached. These software limits are called "soft limits". The operating range of the manipulator is controlled by the following two soft limits.

- Maximum motion range for each axis
- Cubic operation area set parallel to the robot coordinate system

These soft limits are continually monitored by the system, and the manipulator automatically stops when its TCP reaches a soft limit.

When the manipulator is stopped at a soft limit, temporarily release the soft limit by the following procedure, then move the manipulator away from the soft limit in a direction opposite to the earlier operation direction.

1. Select (ROBOT) under the main menu.
2. Select (LIMIT RELEASE).
   - The LIMIT RELEASE window appears.
3. Select “SOFT LIMIT RELEASE”.
   - Each time [SELECT] is pressed, "VALID" and "INVALID" switch alternately.
   - When "SOFT LIMIT RELEASE" is set to "VALID", a message “Soft limits have been released” appears.

   - When "SOFT LIMIT RELEASE" is set to "INVALID", a message “Soft limits off released” is displayed for a few seconds.

**NOTE**

- The taught data cannot be registered when the soft limit is being released.
- The setting of "SOFT LIMIT RELEASE" becomes "INVALID" when the mode is changed to the play mode.
8.11 All Limit Release Function

**CAUTION**

When operating the manipulator with all the limits released, pay careful attention to ensure the safety of the surrounding operation environment.

Since all the limits are released, the manipulator may move beyond its range of motion, which may result in damage to the manipulator or other equipment.

The following limits can be released with the All Limit Release function:

<table>
<thead>
<tr>
<th>Limit Type</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mechanical Limit</td>
<td>Limit to check manipulator’s range of motion.</td>
</tr>
<tr>
<td>L-U Interference</td>
<td>Limit to check L- and U-axis interference area.</td>
</tr>
<tr>
<td>Soft Limit on Each Axis</td>
<td>Soft limit to check manipulator’s range of motion.</td>
</tr>
<tr>
<td>Cube Interference</td>
<td>Limit to check cube interference area set by user.</td>
</tr>
</tbody>
</table>

**NOTE**

All limit release function is not available if the security mode is not in the management mode. Refer to chapter 7 “Security System” for details on the security modes.
8 System Setup
8.11 All Limit Release Function

1. Select (ROBOT) under the main menu.

2. Select (LIMIT RELEASE).
   – The LIMIT RELEASE window appears.

3. Select “ALL LIMITS RELEASE”.
   – “VALID” and “INVALID” are displayed alternately every time [SELECT] is pressed.
   – When “ALL LIMIT RELEASE” is changed to “VALID”, a message “All limits have been released” is displayed. When the setting changes to “INVALID”, a message “All limits off released” is displayed for a few seconds.
8.12 Instruction Level Setting

8.12.1 Setting Contents

8.12.1.1 Instruction Set

There are three instruction sets that can be used when registering the instructions for the robot programming language (INFORM III): the subset instruction set, the standard instruction set, and the expanded instruction set.

Subset Instruction Set

The instructions displayed in the instruction list are limited to just those that are most frequently used, reducing the number of instructions that can be registered. Since few instructions are shown, selection and input are simple.

Standard Instruction Set / Expanded Instruction Set

All the INFORM III instructions can be used. The number of additional items to be used in each instruction differ in the standard instruction set and expansion instruction set.

In the standard instruction set, the following functions cannot be used. However, operation becomes easier because the number of data items decreases when registering an instruction.

- Use of local variables and arrangement variable
- Use of variables for additional items (Example: MOVJ VJ = I000)

When instructions are executed, for example during playback, all the instructions can be executed regardless of the instruction set used.

Fig. 8-5: Instruction Set
8 System Setup
8.12 Instruction Level Setting

8.12.1.2 Learning Function

When an instruction is entered from the instruction list, the additional items that were entered last time are also shown. This function can simplify instruction input.

- To register the same additional items as those in the former operation, register them without changing.

1. An instruction is registered.

2. The next time an attempt is made to register the same instruction as in 1, the same additional items as were registered last time are also shown in the input buffer line.
8.12.2 Setting the Instruction Set Level

1. Select {SETUP} under the main menu.
2. Select {TEACHING COND}.
   - The TEACHING CONDITION window appears.

3. Select “LANGUAGE LEVEL”.
   - The selection list appears.
4. Select desired language level.
   – Language level is set.
8 System Setup
8.12 Instruction Level Setting

8.12.3 Setting the Learning Function

The learning function is set at "VALID" by default.

1. Select (SETUP) under the main menu.

2. Select (TEACHIG COND).
   - The TEACHING CONDITION window appears.

3. Select "INSTRUCTION INPUT LEARNING".
   - "VALID" and "INVALID" are displayed alternately every time [SELECT] is pressed.
8.13 Setting the Controller Clock

The clock inside the YRC1000 microcontroller can be set as follows.

1. Select {SETUP} under the main menu.
2. Select {DATE/TIME}.
   - The DATE/TIME SET window appears.
3. Select “DATE” or “TIME”.
   - The input buffer line appears.
4. Input the new date/time.
   - For instance, to set the date to April 30, 2016, input “2016.4.30”.
   - To set the time at twelve o’clock, enter “12.00”.
5. Press [ENTER].
   - The date/time is changed.
8.14 Setting the Play Speed

1. Select {SETUP} under the main menu.

2. Select {SET SPEED}.
   – The SPEED SET window is shown.

3. Press the [PAGE].
   – When two or more manipulators and stations exist in the system, use the [PAGE] to change the control group, or click on [PAGE] to select the desired control group.

4. Select “JOINT” or “LNR/CIR”.
   – The type of speed alternately changes from “JOINT” to “LNR/CIR”.
8 System Setup
8.14 Setting the Play Speed

5. Select the speed to modify.
   – The input buffer line appears.

6. Input the speed value.

7. Press [ENTER].
   – The speed is modified.
8.15 Numeric Key Customize Function

8.15.1 About the Numeric Key Customize Function

With this function, the user can set the function of the specific keys for each application to the other function. The specific keys are allocated to the numeric keys on the programming pendant. Since any frequently used operation can be allocated to the numeric keys on the programming pendant, the number of key operations is decreased and which reduces the teaching time.

![NOTE]
The Numeric Key Customize Function is allowed to set only when the security mode is in the management mode or higher.

8.15.2 Allocatable Functions

There are two allocation methods as follows:

- Key Allocation (EACH)
- Key Allocation (SIM)

8.15.2.1 Key Allocation (EACH)

With key allocation (EACH), the manipulator operates according to the allocated function when the numeric key is pressed. The allocatable functions are listed below.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manufacturer allocation</td>
<td>Allocated by YASKAWA. Allocating another function invalidates the function allocated by the manufacturer.</td>
</tr>
<tr>
<td>Instruction allocation</td>
<td>Allocates any instructions assigned by the user.</td>
</tr>
<tr>
<td>Job call allocation</td>
<td>Allocates job call instructions (CALL instructions). The jobs to be called are only those registered in the reserved job names. (Specified by the registration No.)</td>
</tr>
<tr>
<td>Display allocation</td>
<td>Allocates any displays assigned by the user.</td>
</tr>
</tbody>
</table>
With key allocation (SIM), the manipulator operates according to the allocated function when the [INTERLOCK] and the numeric key are pressed at the same time. The allocatable functions are listed below.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alternate output allocation</td>
<td>Turns ON/OFF the specified GP output signal when [INTERLOCK] and the allocated Numeric key are pressed at the same time.</td>
</tr>
<tr>
<td>Momentary output allocation</td>
<td>Turns ON the specified GP output signal when [INTERLOCK] and the allocated Numeric key are pressed at the same time.</td>
</tr>
<tr>
<td>Pulse output allocation</td>
<td>Turns ON the specified GP output signal only for the specified period when [INTERLOCK] and the allocated Numeric key are pressed at the same time.</td>
</tr>
<tr>
<td>Group output allocation (4-bit/8-bit)</td>
<td>Sends the specified output to the specified GP group output signals when [INTERLOCK] and the allocated Numeric key are pressed at the same time.</td>
</tr>
<tr>
<td>Analog output allocation</td>
<td>Sends the specified voltage to the specified output port when [INTERLOCK] and the allocated Numeric key are pressed at the same time.</td>
</tr>
<tr>
<td>Analog incremental output allocation</td>
<td>Sends the voltage increased by the specified value to the specified output port when [INTERLOCK] and the allocated Numeric key are pressed at the same time.</td>
</tr>
</tbody>
</table>

In a system for multiple applications, a numeric key can be allocated for each application.
8.15.3 Allocating Operation

8.15.3.1 Allocation Window

1. Select {SETUP} under the main menu.
2. Select {KEY ALLOCATION}.
   – The KEY ALLOCATION (EACH) window appears.

3. Select {DISPLAY}.
   – Pull-down menu appears.
   – To call up the KEY ALLOCATION (SIM) window, select {ALLOCATE SIM. KEY}.
4. Select (ALLOCATE SIM. KEY).

- The KEY ALLOCATION (SIM) window appears.
- In a system multiple applications, press the [PAGE] to change the window to the allocation window for each application, or click on [PAGE] to select the desired application number.

8.15.3.2 Instruction Allocation

1. Set this function in the KEY ALLOCATION (EACH) window. Move the cursor to “FUNCTION” of the key to be allocated and press [SELECT].

- Selection list appears.
2. **Select “INSTRUCTION”**.

   – The instruction is shown in the “ALLOCATION CONTENT”.

   (1) To change the instruction, move the cursor to the instruction and press [SELECT]. Then the instruction group list appears.

   (2) Select the group which contains the instruction to modify.

   (3) When the instruction list dialog box is shown, select the instruction to be changed.
8.15.3.3 Job Call Allocation

Set this function in the KEY ALLOCATION (EACH) window.

1. Move the cursor to the "FUNCTION" of the key to be allocated and press [SELECT].
   – A selection list appears.

2. Select “JOB CALL”.
   – The reserved job registration No. is shown in the “ALLOCATION CONTENT” (reserved job registration No.: 1 to 10).
   – The reserved job registration is performed in the reserved job name window.

   (1) To change the reserved job registration No. move the cursor to the No. and press [SELECT]. Then input buffer line appears.

   (2) Input the number to be changed, and press [ENTER].

8.15.3.4 Display Allocation

Set this function in the KEY ALLOCATION (EACH) window.

1. Move the cursor to the "FUNCTION" of the key to be allocated and press [SELECT].
   – Selection list appears.

2. Select [DISPLAY].

3. Move the cursor to "ALLOCATION CONTENT" and press [SELECT].
   – Character input is available.
4. Input the name of the reserved window and press [ENTER].
   - The reserved name input to the “ALLOCATION CONTENT” is shown.

5. Open the window for allocation.

6. Press [INTERLOCK] and the allocated key at the same time.
   - A message “Reserved display registered” appears, and the window is registered.
   - In this case, the CURRENT POSITION window is registered by pressing [INTERLOCK] + [0] with the CURRENT POSITION window displayed on the screen.

When allocate the display allocation to a key, key allocation (SIM) will be set to the display set.

Unable to allocate the display allocation and the another function to the same key.
8.15.3.5 Alternate Output Allocation

Set this function in the KEY ALLOCATION (SIM) window.

1. Move the cursor to the "FUNCTION" of the key to be allocated and press [SELECT].
   – Selection list appears.

2. Select "ALTERNATE OUTPUT".
   – The output No. is displayed in the "ALLOCATION CONTENT".

(1) To change the output No., move the cursor to the No. and press [SELECT]. Then numeric value can be entered.

(2) Input the number to be changed, and press [ENTER].
8.15.3.6 Momentary Output Allocation

Set this function in the KEY ALLOCATION (SIM) window.

1. Move the cursor to the “FUNCTION” of the key to be allocated and press [SELECT].
   – A selection list appears.

2. Select “MOMENTARY OUTPUT”.
   – The output No. is displayed in the “ALLOCATION CONTENT”.

(1) To change the output No., move the cursor to the No. and press [SELECT]. Then numeric value can be entered.

(2) Input the number to be changed, and press [ENTER].
8.15.3.7 Pulse Output Allocation

Set this function in the KEY ALLOCATION (SIM) window.

1. Move the cursor to the "FUNCTION" of the key to be allocated and press [SELECT].
   – A selection list appears.

2. Select "PULSE OUTPUT".
   – The output No. and output time are displayed in the "ALLOCATION CONTENT".

(1) To change the output No. or output time, move the cursor to the No. or time and press [SELECT]. Then numeric value can be entered.

(2) Input the number or time to be changed, and press [ENTER].
8.15 Numeric Key Customize Function

8.15.3.8 Group (4-bit/8-bit) Output Allocation

Set this function in the KEY ALLOCATION (SIM) window.

1. Move the cursor to the “FUNCTION” of the key to be allocated and press [SELECT].
   – A selection list appears.

2. Select “4 BIT OUTPUT” or “8 BIT OUTPUT”.
   – The output No. and output value are displayed in the “ALLOCATION CONTENT”.

(1) To change the output No. or output value, move the cursor to the No. or value and press [SELECT]. Then numeric value can be entered.

(2) Input the number or value to be changed, and press [ENTER].
8 System Setup
8.15 Numeric Key Customize Function

8.15.3.9 Analog Output Allocation

Set this function in the KEY ALLOCATION (SIM) window.

1. Move the cursor to the "FUNCTION" of the key to be allocated and press [SELECT].
   – A selection list appears.

2. Select "ANALOG OUTPUT".
   – The output port number and the output voltage value are displayed in the "ALLOCATION CONTENT".

(1) To change the output port No. or output voltage value, move the cursor to the No. or voltage value and press [SELECT]. Then numeric value can be entered.

(2) Input the number or voltage value to be changed, and press [ENTER]
8 System Setup
8.15 Numeric Key Customize Function

8.15.3.10 Analog Incremental Output Allocation

Set this function in the KEY ALLOCATION (SIM) window.

1. Move the cursor to the “FUNCTION” of the key to be allocated and press [SELECT].
   - A selection list appears.

2. Select “ANALOG INC OUTPUT”.
   - The output port No. and incremental value are displayed in the “ALLOCATION CONTENT”.

(1) To change the output port No. or incremental value, move the cursor to the No. or incremental value and press [SELECT]. Then numeric values can be entered.

(2) Input the number or incremental value to be changed, and press [ENTER].
8.15 Numeric Key Customize Function

### Allocation of I/O Control Instructions

In key allocation (SIM), output control instructions can be allocated to the numeric keys that have been allocated one of the following I/O controls with key allocation (EACH).

<table>
<thead>
<tr>
<th>Function</th>
<th>Output Control Instruction allowed to be Allocated</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alternate output allocation</td>
<td>DOUT OT# (No.) ON</td>
</tr>
<tr>
<td>Momentary output allocation</td>
<td></td>
</tr>
<tr>
<td>Pulse output allocation</td>
<td>PULSE OT# (No.) T = output time</td>
</tr>
<tr>
<td>Group output allocation (4-bit)</td>
<td>DOUT OGH (No.) output value</td>
</tr>
<tr>
<td>Group output allocation (8-bit)</td>
<td>DOUT OG# (No.) output value</td>
</tr>
<tr>
<td>Analog output allocation</td>
<td>AOUT AO# (No.) output voltage value</td>
</tr>
</tbody>
</table>

1. Allocation of I/O control instruction.
   - Allocate the I/O control instruction with key allocation (SIM) following the aforementioned procedure.

2. Move the cursor to the "FUNCTION" of the key that has been allocated with I/O control with key allocation (SIM) and press [SELECT].
   - Selection list appears.
3. Select “OUTPUT CONTROL INST”.

   - The instruction corresponding to the I/O control allocated by key allocation (SIM) is displayed in the “ALLOCATION CONTENT”.

   - The allocated instruction changes automatically when “ALLOCATION CONTENT” is changed by key allocation (SIM). Even if the I/O control allocation is changed to the default setting allocated by the manufacturer with key allocation (SIM), the settings for key allocation (EACH) remain the same.
8.15.5 Execution of Allocation

8.15.5.1 Executing the Instruction/Output Control Allocation
1. Press the key allocated for instruction allocation or output control allocation.
   - The allocated instruction is displayed in the input buffer line.

   ![Instruction Displayed](image1)

2. Press [INSERT] and [ENTER].
   - The instruction displayed in the input buffer line is registered.

   ![Instruction Registered](image2)

8.15.5.2 Executing the Job Call Allocation
1. Press the key allocated for the job call allocation.
   - The CALL instruction is displayed in the input buffer line.

2. Press [INSERT] then [ENTER].
   - The CALL instruction shown in the input buffer line is registered.

8.15.5.3 Executing the Display Allocation
1. Press the key allocated for the display allocation.
   - The allocated display appears.

8.15.5.4 Executing the I/O Control Allocation
Alternate output allocation, momentary output allocation, pulse output allocation, group output allocation (4-bit/8-bit), analog output allocation, analog incremental output allocation are executed by the following operation.
1. Press [INTERLOCK] and the key allocated for I/O control allocation at the same time.
   - Allocated functions are executed.
8.16 Changing the Output Status

The status of GP output signals can be changed from the programming pendant by using either of the following two methods.

- On the GP output status window
- On the RELAY ON window

The method that uses the RELAY ON window, which is described here, simplifies the operation for changing the status of signals that are used frequently.

1. Select {IN/OUT} under the main menu.
2. Select {RELAY ON}.
   - The RELAY ON window appears.
3. Select the desired signal to change the output status.
   - Select the status (● or ○) of the desired signal.

A maximum of 64 GP output signals can be shown on the RELAY ON window and the number of the signals which are shown in the parameters S4C327 to S4C390 must be set in advance. If they are not set, the sub menu in the RELAY ON window will not be displayed.
4. Press [INTERLOCK] +[SELECT].

- The output status is changed. (●: status ON; ○: status OFF.)

It is also possible to turn the relevant GP output signal ON only for the duration that [INTERLOCK]+[SELECT] are pressed. This selection is made in advance by setting the parameters (S4C391 to 454) to “1.”
8.17 Changing the Parameter Setting

The parameters are protected not to be changed easily. The following operations are allowed only for the operator who can set the security mode to the management mode or higher. The operations must be performed properly.

1. Select {PARAMETER} under the main menu.
2. Select the parameter type.
   - The PARAMETER window appears. Select the desired parameter.
3. Move the cursor to the desired parameter number.
When the desired parameter number is not in the current window, move the cursor in the following way:

1. Move the cursor to a parameter number and press [SELECT].

2. Enter the desired parameter number with the numeric keys.

3. Press [ENTER].

4. The cursor moves to the selected parameter number.
8 System Setup
8.17 Changing the Parameter Setting

Set the parameters in the following manner.

1. Select the parameter data to be set.
   
   (1) Move the cursor to the parameter number data (decimal or binary) in the PARAMETER window, and press [SELECT].
   
   (2) To enter a decimal setting, select the decimal figure.
   
   (3) To enter a binary setting, select the binary figure.

2. Enter the value.
   
   – If a decimal figure is selected, enter a decimal value with the numeric keys.

   – If a binary figure is selected, move the cursor to the binary figure data in the input buffer line, and press [SELECT].

   – Each time [SELECT] is pressed, “0” and “1” alternate in the window.

   – “0” or “1” can also be entered with the numeric keys.

3. Press [ENTER].
   
   – The new setting appears in the position where the cursor is located.
8.18 File Initialization

8.18.1 Initializing Job File

1. Turn ON the power supply again while pressing [MAIN MENU] on the programming pendant simultaneously.
2. Change the security mode to the management mode.
3. Select {FILE} under the main menu.
4. Select {INITIALIZE}.
   – The INITIALIZE window appears.
5. Select {JOB}.
   – A confirmation dialog box appears.
8.18 File Initialization

6. Select {YES}.
   - The job data is initialized.

   **NOTE**
   When JOB is initialized, the following files are reset at the same time. Be careful when initializing JOB.
   - User coordinates
   - Memory play file
   - Variable data
   - Robot calibration data
   - Conveyor calibration data

### 8.18.2 Initializing Data File

1. Turn ON the power supply again while pressing [MAIN MENU] on the programming pendant simultaneously.
2. Change the security mode to the management mode.
3. Select {FILE} under the main menu.
4. Select {INITIALIZE}.
5. Select {FILE/GENERAL DATA}.
   - The INITIALIZE window appears.
6. Select the data file to be initialized.
   - The selected data file/general data are marked with “★”.
   - The parameters marked with “□” cannot be selected.

7. Press [ENTER].
   - A confirmation dialog box appears.

8. Select (YES).
   - The selected data file/general data are initialized.
8.18.3 Initializing Parameter File

1. Turn ON the power supply again while pressing [MAIN MENU] on the programming pendant simultaneously.

2. Change the security mode to the management mode.

3. Select {FILE} under the main menu.

4. Select {INITIALIZE}.

5. Select {PARAMETER}.

   – The parameter selection window appears.

6. Select the parameter to be initialized.

   – The selected parameter is marked with "★".

   – The parameters marked with "■" cannot be selected.
7. Press [ENTER].
   - A confirmation dialog box appears.

8. Select {YES}.
   - The selected parameter is initialized.

8.18.4 Initializing I/O Data

1. Turn ON the power supply again while pressing [MAIN MENU] on the programming pendant simultaneously.
2. Change the security mode to the management mode.
3. Select {FILE} under the main menu.
4. Select {INITIALIZE}.
5. Select {I/O DATA}.
   - The I/O data selection window appears.
6. Select data to be initialized.
   - The selected data is marked with "★".
   - The I/O data marked with "n" cannot be selected.

7. Press [ENTER].
   - A confirmation dialog box appears.

8. Select {YES}.
   - The selected data is initialized.
8.18.5 Initializing System Data

1. Turn ON the power supply again while pressing [MAIN MENU] on the programming pendant simultaneously.
2. Change the security mode to the management mode.
3. Select (FILE) under the main menu.
4. Select (INITIALIZE).
5. Select (SYSTEM DATA).
   - The system data selection window appears.

6. Select the parameter to be initialized.
   - The selected data is marked with "★".
   - The system data marked with "◆" cannot be selected.
8. System Setup
8.18 File Initialization

7. Press [ENTER].
   – A confirmation dialog box appears.

8. Select {YES}.
   – The selected data is initialized.
8.18.6 Reset Safety Circuit Board FLASH Data

8.18.6.1 Saving Dual Data

The data related to the safety function is saved in the safety circuit board memory in a duplicated manner for safety.

When the control power is turned ON, check is performed to see that dual data sets are the same.

If they are different when the control power is turned ON, the following alarm occurs.

Alarm 0300: “VERIFY ERROR(SYSTEM CONFIG-DATA)[10]”

In the system with the functional safety function, a message “Select ‘Safety Board FLASH Reset’ in the maintenance mode” is displayed after the following operations.

Turning ON or OFF causes error in verification.

• The data related to the safety function is loaded from an external storage.
• A parameter related to the safety function is rewrote by setting operations in maintenance mode.
• The zeroing function is performed.
• Encoder is reset

In case one of the above mentioned operations is performed, re-set the data following the procedures shown in chapter 8.18.6.2 “FLASH Data Reset”.

In the maintenance mode, there are cases when parameters related to the safety function are rewrote by several setting operations.

For this reason, the message “Select ‘Safety Board FLASH Reset’” may be displayed.

Perform the safety board FLASH reset operation by following the procedure shown in chapter 8.18.6.2.
8.18.6.2 FLASH Data Reset

If the following alarm occurs when the control power supply is turned ON, Alarm 0300: "VERIFY ERROR(SYSTEM CONFIG-DATA)[10]" perform the following operations to re-set the data of the function safety board.

1. When the controller power is turned ON, Alarm 0300: "VERIFY ERROR(SYSTEM CONFIG-DATA)[10]" occurs and the maintenance mode is started up.

2. Select {SYSTEM} under the main menu. Then, press {SECURITY} to change the security mode to the safety mode.

3. Select {FILE} under the main menu. Then, select {INITIALIZE} under the sub menu.

   – INITIALIZE window appears.
4. Move the cursor to 'Safety Board FLASH Reset' and press [ENTER].

5. The dialog box "Reset?" is displayed. Select (YES).
   - The data of the safety circuit board is re-set. A few seconds later, the buzzer sounds and the data setting is completed.

6. When the data reset is completed, turn the control power OFF and then turn the power ON again.
8 System Setup
8.18 File Initialization

8.18.7 Reset 3DGraphics Robot Model

1. Turn ON the power supply again while pressing [MAIN MENU] on the programming pendant simultaneously.
2. Change the security mode to the management mode.
3. Select (FILE) under the main menu.
4. Select (INITIALIZE).
   – The INITIALIZE window appears.
5. Select { 3DGraphics Robot Model Reset}.
   – A confirmation dialog box appears.
6. Select (YES).
   – The 3D graphic model is reset.
8.19 Display Setting Function

8.19.1 Font Size Setting

YRC1000micro enables changing the font size displayed on the screen.

The fonts displayed on the screen can be selected from eight patterns of fonts in the font size setting dialog box.

8.19.1.1 Applicable Range for the Font Size Change

Changing the font size is allowed in the general display area indicated in the following figure:

![General display area]

8.19.1.2 Settable Font Size

The following eight patterns of fonts are available in setting the size of fonts displayed on the screen.

<table>
<thead>
<tr>
<th>Font Size</th>
<th>Font Style</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Small</td>
</tr>
<tr>
<td>2</td>
<td>Small</td>
</tr>
<tr>
<td>3</td>
<td>Regular</td>
</tr>
<tr>
<td>4</td>
<td>Regular</td>
</tr>
<tr>
<td>5</td>
<td>Large</td>
</tr>
<tr>
<td>6</td>
<td>Large</td>
</tr>
<tr>
<td>7</td>
<td>Extra large</td>
</tr>
<tr>
<td>8</td>
<td>Extra large</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Font Size</th>

</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Regular</td>
</tr>
<tr>
<td>2</td>
<td>Bold</td>
</tr>
<tr>
<td>3</td>
<td>Regular</td>
</tr>
<tr>
<td>4</td>
<td>Bold</td>
</tr>
<tr>
<td>5</td>
<td>Regular</td>
</tr>
<tr>
<td>6</td>
<td>Bold</td>
</tr>
<tr>
<td>7</td>
<td>Regular</td>
</tr>
<tr>
<td>8</td>
<td>Bold</td>
</tr>
</tbody>
</table>
8.19.1.3 Setting the Font Size

To set the font size, first off display the font size setting dialog box as follows.

1. Select (DISPLAY SETUP) then (CHANGE FONT) under the main menu.

![Display Setup Menu]

2. The font size setting dialog box appears on the center of the current window.

![Font Size Setting Dialog Box]
To set the font size in the font size setting dialog box, follow the procedure below.

1. Specify the font style.
   - The (Bold Type) check box can be checked or unchecked alternately each time the check box is selected.
   • Check the (Bold Type) check box as follows to set the font to the bold style.
   • Clear the (Bold Type) check box as follows to set the font to the regular style.

2. Specify the font size.
   - Select a button from the four buttons in the dialog box.
8.19 Display Setting Function

3. The font size setting dialog box is closed, and the screen displays the font specified in the dialog box.

   ![Image of the font size setting dialog box]

- To cancel the setting of the font size, follow the procedure below.

1. Select {Cancel} in the font size setting dialog box.

   ![Image of selecting Cancel]

2. The dialog box closes without changing the font size.

   ![Image of the closed dialog box]

**NOTE**

Do not turn OFF the YRC1000micro power supply when the font size is being changed (when the font size setting dialog box is on the screen).

8-163
8.19 Display Setting Function

8.19.2 Operation Button Size Setting

YRC1000micro enables changing the size of operation buttons. The button size in the main menu area, menu area, and instruction list can be respectively selected from three sizes.

8.19.2.1 Applicable Range for the Button Size Change

Changing the button size is allowed in the main menu, menu (pull-down menu), and instruction list indicated in the following figure:

![Button Size Change Figure]

8.19.2.2 Settable Button Size

The following three sizes of buttons are available in setting the size of each operation button; the font style of the character string on buttons can also be specified.

<table>
<thead>
<tr>
<th>Button Size</th>
<th>Font Style</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Small</td>
<td>Regular</td>
</tr>
<tr>

</tr>
</tbody>
</table>

8.19.2.3 Setting the Button Size

To set the button size, first off display the button size setting dialog box as follows.
1. Select {DISPLAY SETUP} then {CHANGE BUTTON} under the main menu. The font size setting dialog box appears on the center of the current window.
To set the button size in the button size setting dialog box, follow the procedure below.

1. Specify the area to set the button size.
   (1) Select the desired area from the area setting buttons.
   (2) The buttons in the selected area is subject to size setting.
   (3) Note that only the last-selected button determines the area subject to size setting, even if settings are performed several times before then.

2. Specify the font style.
   – The (Bold Type) check box can be checked or unchecked alternately each time the check box is selected.
   • Check the (Bold Type) check box as follows to set the font to the bold style.
   • Clear the (Bold Type) check box as follows to set the font to the regular style.
3. Specify the button size.
   – Select a button from the three buttons in the dialog box.

4. The font size setting dialog box is closed, and the screen displays the buttons specified in the dialog box.
   – The modification is applied only to the buttons in the area selected with the area setting button. (In this example, the change is applied only to the pull-down menu buttons in the menu area.)
To cancel the setting of the button size, follow the procedure below.

1. Select (Cancel) in the button size setting dialog box.

   ![Dialog box showing the button size setting]

   - The dialog box closes without changing the button size.

   ![Dialog box showing the button size setting]

   **NOTE**

   Do not turn OFF the YRC1000micro power supply when the button size is being changed (when the button size setting dialog box is on the screen, or when an hourglass is indicated in the middle of the screen).
8.19.3 Initialization of Screen Layout

The font/button size changed with the font/button size setting function can be collectively changed back to the regular size.

8.19.3.1 Initializing the Screen Layout

To initialize the screen layout, follow the procedure below.

1. Select {DISPLAY SETUP} then {INITIALIZE LAYOUT} under the main menu.

   ![Diagram](image)

   A confirmation dialog box appears on the center of the current window.

   ![Diagram](image)
To Initialize the screen layout, follow the procedure below.

1. select (OK).

- The dialog box is closed, and the font/button sizes are collectively changed to the regular size.
To cancel the Initialized screen layout, follow the procedure below.

1. Select {CANCEL}.

The dialog box closes without changing the current screen layout.

Do not turn OFF the YRC1000 micro power supply when the screen layout is being initialized (when the confirmation dialog box is on the screen, or when an hourglass is indicated in the middle of the screen).

8.19.4 Layout Storage

The settings of the font or button sizes are saved in the programming pendant. The screen displays the font/button size specified last time with the current programming pendant.
8.20  Encoder Back-Up Error Recovery Function

8.20.1  About Encoder Back-Up Error Recovery Function

A motor of the robot, the travel axis or the rotation station which is controlled by the YRC1000micro is connected with the back-up battery in order to keep the position information even though the control power is disconnected. This battery consumes battery power through time, and the alarm "4312 ENCODER BATTERY ERROR" occurs when the voltage becomes lower than 2.8V. If the battery is not replaced and keep consuming more battery power, it will cause the lost of the position information. In addition, the alarm "4311 ENCODER BACK-UP ERROR" occurs. Meanwhile, there would be a gap between the manipulator position and the position of the absolute encoder.

This function is used to recover the absolute data by moving the axis whose position information is lost to a position close to the home position by axis operation.

8.20.2  Encoder Back-Up Error Recovery Function Operation

1. Press {SELECT}.
   – When select the “RESET” in the alarm display, the alarm is reset. The manipulator can be move by the axis operation key.

2. Adjust the alarm occurring axis to the home position mark of the each manipulator axis by the axis operation key.

3. Change the security mode to the management mode.
   – Refer to chapter 7.1.1.1 “Changing the Security Mode” for the operation of the changing the security mode.

4. Select (ROBOT) in the main menu.

5. Select (HOME POSITIONNING).
   – The home positioning display appears. The absolute data of the axis which is occurring the encoder back-up error appears with the "✻" which indicates the undefined state.

6. Select the control group.
7. Select {UTILITY} in the menu.
   – The pull-down menu appears.

8. Select {BACKUP ALM RECOVERY} in the menu.
   – The back-up alarm recovery display appears.

9. Select the axis to be fixed.
   – Move the cursor over the axis to fix, and select it. The confirmation dialog appears.
10. Select {YES}.
   - The absolute data of the selected axis is recovered.
   - Select {NO} to cancel the operation.

11. Select the current position.
   - To display the current position window, refer to "YRC1000micro MAINTENANCE MANUAL (RE-CHO-A115) 7.8.1 Current Position Window".

12. Confirm the current position.
   - Confirm the recovered current position, and modify the followings depending on its values.
     (1) The pulse number is approximately "0".
        • Recovered normally.
     (2) The pulse number is approximately "4096".
        • Move the recovered axis to the 4096 pulse position, and register the individual axis to calibrate the home position.
     (3) The pulse number is approximately "-4096".
        • Move the recovered axis to the -4096 pulse position, and register the individual axis to calibrate the home position.
As for the registering the individual axis, refer to chapter 8.1.2.2 “Registering Individual Axes”.
8.21 Preventive Maintenance Function

8.21.1 Preventive Maintenance Function

The preventive maintenance function contains the function which provides the information of diagnosis the duration of life for the speed reducer and the function which informs the inspection time of the robot. Furthermore, it contains the function which provides the information of the life span of the controller components. Use these functions for the preventive maintenance for the robot.

The followings are the features.

• Preventive maintenance function for the speed reducer
• Inspection notice function
• Preventive maintenance function for the hardware

8.21.2 Preventive Maintenance Function for the Speed Reducer

Diagnoses the duration of life for the speed reducer by using the both methods of the lifetime calculation and the torque average value. The diagnosis is executed by operating the job in the play mode. It is unnecessary to prepare the job for this diagnosis.

NOTE

• The accuracy of the performance of the life diagnosis is not guaranteed. Use this function as the one of the methods to determine the duration of life for the speed reducer.
• If the periodic grease replenishment and grease replacement are not performed, or the excessive pressure is applied to the speed reducer, such as the mechanical interference etc, it will be failed before reaching to the diagnosis period.
• The diagnosis is performed by executing the job in the play mode. When operating the robot in the teach mode (operation by the axis key, FWD operation and test operation), the life diagnosis function is not performed.
8.21 Preventive Maintenance Function

8.21.2.1 Diagnose by the Lifetime Calculation

- **Outline**
  This function calculates the torque and the speed of each axis during the job operation, and diagnoses the time to replace the speed reducer by the lifetime calculation. The replacement time is informed by displaying the message and turning the replacement signal ON.

  Operating the job in the play mode performs the diagnosis automatically.

  **NOTE**
  This function is only available for the robot axes. As for the external axes, this function is not available.

- **Set the Replacement Signal**
  Set the GP output signal to notify the replacement time by following procedures.
  1. Change the security mode to the management mode.
  2. Select {PM} in the main menu.
  3. Select {PM(REDUCER)}.
  4. Select {DISPLAY} in the menu.

  – {=SETUP CONDITION} appears under the pull down menu.
5. Select {SETUP CONDITION}.  
   - The condition setup window is appears.

6. Move the cursor to over the {REPLACEMENT SIGNAL}, and select.  
   - Able to enter the values.

7. Enter the GP output signal.
8 System Setup
8.21 Preventive Maintenance Function

Lifetime Calculation Window

1. Select {PM} in the main menu.
2. Select {PM(REDUCTOR)}.

- The lifetime calculation window appears. In the case of the another window appears, select {DISPLAY}, and select the (=LIFE CALCULATION) in the pull down menu to display the lifetime calculation window.

Each item on the screen represents the following description.

① =TIME TO REPLACEMENT
Displays the rest of the lifetime to replace the speed reducer. The calculation of the subtraction of the number is operated automatically by performing the job in the play mode.

② =NOTICE TIME
By setting the time in this item, the replacement time is informed by displaying the message and turning the replacement signal ON before the "TIME TO REPLACEMENT" becomes "0".

For example, when setting with "100", the message will be displayed 100 hours before the "TIME TO REPLACEMENT" becomes "0", and the replacement signal will be turned ON as well.

For example, when setting with "-100", the message will be displayed 100 hours after the "TIME TO REPLACEMENT" became "0", and the replacement signal will be turned ON as well.

③ =WARNING
Select this item to invalidate the notification signal and displaying the message. [Invalid] and [Valid] will alternate each time when pressing the [Select].

④ =RESET
Select this item after replacing the speed reducer. Addition to the message is deleted, and the replacement signal is OFF, "TIME TO REPLACEMENT" is reset.
8 System Setup
8.21 Preventive Maintenance Function

Invalidate the Replacement Signal and the Message Display
Able to invalidate the replacement signal and the message display in each axis. Invalidate the replacement signal and the message display by the following procedures, in the case of the speed reducer seems to operate normally even though the replacement signal is turned ON.

1. Change the security mode to the management mode.
2. Select {=PM} in the main menu.
3. Select {=PM(REDUCER)}.
   - The lifetime calculation window appears. In the case of the another window appears, select [DISPLAY], and select the (=LIFE CALCULATION) in the pull down menu to display the lifetime calculation window.

4. Move the cursor over the "=WARNING" to invalidate the desired axis, and select [Select]. [Invalid] and [Valid] will alternate each time when press the [Select].

![Lifetime Calculation Window]

---

8-179
8 System Setup
8.21 Preventive Maintenance Function

Graph Display
The lifetime calculation can be checked in the graph. The shift of lifetime calculation is shown on the programming pendant, so that it is possible to check visually how the lifetime decreases. Use this function as a method to judge the lifetime of the speed reducer. The graph is shown by the following procedures.

1. Select (PM) of main menu.
2. Select (PM(REDUCER)).
3. Select (DISPLAY):
   – The pull down menu is shown.
   4. Select (GRAPH).
      – The graph is shown.

1. Select {PM} of main menu.
2. Select {PM(REDUCER)}.
3. Select {DISPLAY}:
   – The pull down menu is shown.
   4. Select {GRAPH}.
      – The graph is shown.
5. Select {GRAPH}.
   – The pull down menu is shown.

6. Select {Lifetime}
   – The calculation result is shown as a graph.

The vertical axis of the graph indicates the time to replace. The horizontal axis indicates the operation time.
To change the display range of the horizontal axis, modify the MIN and MAX values of display time.
To change the display range of the vertical axis, modify the MIN and MAX values of time to replace.
By pressing {CSV Save}, the lifetime calculation data can be saved as a CSV format into the external memory device.
For the other operations, refer to chapter 8.21.2.2 “Diagnose by the Torque Average Value”.

8-181
8.21.2.2 Diagnose by the Torque Average Value

**Diagnosis Element**

Monitors the torque waveform during the job operation, and calculates the average value of the vibration amplitude by extracting the waveform from the torque arising from the speed reducer. This data is called the torque average value, and it is the basis data to diagnose the lifetime. The following chart shows the lifetime curved line according to the torque average value and the operation hours.

As the condition of the speed reducer is changing to “deterioration” from “normal operation”, the torque element changes to “increase” from “normal”. It is estimated that the speed reducer is in the deterioration period as the number of the torque element is increasing by the deterioration of the speed reducer.

This function records the torque element arising from the deterioration of the speed reducer on a daily basis, and diagnoses the lifetime of the speed reducer by monitoring the change of the torque element.

By operating a job in the play mode, a data (the torque element arising from the deterioration of the speed reducer) for each axis is recorded automatically on a daily basis, and the data is accumulated.
When the difference value between the latest value “the average value from the measured result of the five days (the initial value) including the day to diagnose” and the average value “the average of 30 days (the initial value) between prior to 60 days from the day to diagnose and prior to 90 days from the day to diagnose” becomes the threshold value or more, it determines the speed reducer is almost failure, and outputs the warning. The average value is indicated with %, and 100% indicates the standard torque.
8 System Setup
8.21 Preventive Maintenance Function

Setting Procedures
The setting procedures are described as follows.

1. Change the security mode to the management mode.
2. Select (=PM) in the main menu.
3. Select (=PM(REDUCER)).
   - The lifetime calculation window appears.

4. Select (DISPLAY) in the menu.
   - The (=SETUP CONDITION) appears in the pull down menu.
5. Select {=SETUP CONDITION}.
   – The setup window appears.
   – Modify the condition as necessary.

6. Select {End} button.

Each item on the screen represents the following description.

① =TORQUE VARIATION ACCEPT RATE

It is determined as accept OK when the measured value (the latest value - the average value) is smaller than the set value or the equal value. It is determined as accept NG when the measured value is greater than the set value. The torque variation accept rate can be set as “High”, “Medium” or “Low”. The initial value of each item is 50%, 40% and 20%.

② =TORQUE VARIATION ALERT OUTPUT

• =ACCEPT RATE HIGH
  The warning output signal is turned ON when the number of the day, which is determined as accept NG (the latest value - the average value \(>\) “=ACCEPT RATE HIGH”), is more than the number of the consecutive days. If unnecessary to output the signal, set the item “0”. The initial value of this item is “0”.

• =ACCEPT RATE MID, LOW
  The GP output signal, which is set by “=ACCEPT RATE MID” and “=ACCEPT RATE LOW”, is turned ON when it is determined as follows. The latest value - the average value \(>\) “=ACCEPT RATE MID”. The latest value - the average value \(>\) “=ACCEPT RATE LOW”. If unnecessary to output the signal, set the item “0”. The initial value of this item is “0”.

③ =CONSECUTIVE DAYS (ACCEPT NG)

It is determined as the speed reducer is almost failure, when the number of the day, which is determined as tolerance NG (the latest value - the average value \(>\) “=ACCEPT RATE HIGH”), is more than the number of this item. The initial value of this item is “3” (days).
8 System Setup
8.21 Preventive Maintenance Function

④ =CALCULATION DAYS
Set the period to calculate the average value. The initial value of this item is “30” (days).

⑤ =ELAPSED DAYS FROM CALC. START
Set the period to calculate the average value from the day to diagnose. The initial value of this item is “60” (days).

⑥ =LATEST MEASURED DAYS
Set the period to calculate the latest value. The initial value of this item is “5” (days).

⑦ =ERROR DELETE FILTER
Use to delete the error when calculate the average value. The following values (torque average) are excepted from the calculation of the average value.

- The average from the previous day exists.
  The average from the previous day / any measurement value of the average period×100 > filter setting value
  The any measurement value of the average period / the average from the previous day×100 > filter setting value
- The average from the previous day does not exist.
  The latest value / any measurement value of the average period×100 > filter setting value
  The any measurement value of the average period / the latest value×100 > filter setting value

The initial value of this item is “200” (%).

⑧ =GRAPH NAME
The name of the graph can be registered.

⑨ =REPLACEMENT SIGNAL
Use this item to calculate the lifetime. Refer to “Set the Replacement Signal”.

NOTE
Even though the initial value is set, the accuracy of the life diagnosis is not guaranteed performance.
Data Confirmation

By operating a job in the play mode, a data (the torque element arising from the deterioration of the speed reducer) for each axis is recorded automatically on a daily basis, and the data is accumulated. It is unnecessary to prepare the job for this diagnosis.

Able to refer to the data by following procedures.

1. Select {=PM} in the main menu.
2. Select {=PM(REDUCER)}.
3. Select {DISPLAY}.
   – The pull down menu appears.
4. Select {=TORQUE MONITOR}.
   – The torque monitor window appears.
   – Able to refer to the data of a date corresponding to the number by pressing the [PAGE] key. Modify the number as necessary.

Unable to measure the torque average value because the axis of the measured value indicating “✻” is not operating, or the motion speed is less than the reference speed.
8 System Setup
8.21 Preventive Maintenance Function

Each item on the screen represents the following description.

① =NG COUNT (IN A ROW)
Shows the number of the variation days, which is higher than the value of the torque variation “HIGH”. The warning output signal, which is set by “=ACCEPT RATE HIGH”, is turned ON when the number of the day above is more than the number of the consecutive accept NG days.

② =NG COUNT (ACCUM.)
Shows the total number of the variation days, which is higher than the value of the torque variation “HIGH”. The number of “=NG COUNT (IN A ROW)” is reset as “0”, when a day does not exceed the torque variation. However, this “=NG COUNT (ACCM.)” will not be reset.

③ =MEASURED DATE
Shows the date of the measurement or the updated speed reducer diagnosis database.

④ =MEAS.
Shows the measured torque average.

⑤ =AVE.
Shows the arithmetic mean of the average period (certain number of the days, which is calculated in the past, based on the MEASURED DATE). However, the measured values excepted in the =ERROR DELETE FILTER are not included.

⑥ =VARIATION (The Determining Value)
Shows the difference value between the latest value and the average value. When this value exceeds the value, which is set at the torque variation, it is determined as accept NG.

⑦ =LATEST
Shows the arithmetic mean of the latest period (certain number of the days included the measured day).

⑧ =WARNING
Select this item to invalidate the warning output signal. [Invalid] and [Valid] will alternate each time when press the [Select].

⑨ =RESET
Select this item after replacement of the speed reducer. The warning output signal will be turned OFF, and the old data will not be used for the lifetime diagnosis.
Invalidate the Warning Output Signal

Able to invalidate for each axis. Invalidate the warning output signal by the following procedures, in the case of the speed reducer seems to operate normally even though the warning output signal is turned ON.

1. Select {=PM} in the main menu.
   - The sub menu appears.
2. Select {=PM(REUCER)}.
   - The lifetime calculation window appears.
3. Select [DISPLAY].
   - The pull down menu appears.
4. Select {TORQUE MONITOR}.
   - The torque monitor window appears.

Move the cursor over the "=WARNING" of the desired axis to invalidate, and press [Select]. [Invalid] and [Valid] will alternate each time when pressing the [Select].
8 System Setup
8.21 Preventive Maintenance Function

Graph Display
After the measurement, the variation can be checked by a graph. The graph is updated every 24 hours automatically. The measured value and changes of the variation can be displayed on the programming pendant. Thus, the changes of the torque can be checked visually. Use the graph display as one of the methods to judge the lifetime of the speed reducer.

The graph can be shown by the following procedures.

1. Select (=PM) in the main menu.
2. Select (=PM(REDUCER)).
3. Select (DISPLAY).
   – The pull down menu appears.
4. Select (=GRAPH).
   – The graph appears.
5. Select (CLOSE).
   – Return to the lifetime calculation window.
Each item on the screen represents the following description.

① = Graph

Select the {Graph}, and the pull down menu appears. Either “=Vari.” or “=Meas.” can be selected.

- When selecting “=Vari.”, the variation (=latest value - average value) appears on the graph. The line of each “Hi”, “Mid” and “Lo” appears. “Hi” means “the torque variation accept high”. “Mid” means “the torque variation accept medium”. “Lo” means “the torque variation accept low”.

When changing “the torque variation accept high”, “the torque variation accept medium” or “the torque variation accept low” on the each setting window, the lines for “Hi”, “Mid” and “Lo” on the graph also correspond to the setting values.

In the case of the graph above, it shows a “variation” > “Lo” of the T-axis, and the warning output signal, which is set by “torque variation low”, is ON.

- When selecting “=Meas.”, the measured value is displayed on the graph.
8 System Setup
8.21 Preventive Maintenance Function

② =Group
Select (=Group), and the pull down menu appears. Select the group to display.

③ =Name
The names set in the each setting window are displayed.

④ =Renew
Pressing the “=Renew” button updates the latest data.

⑤ =Days
Set the number of the days between 5 and 150 days to be displayed. The latest data is displayed on the right side of the graph, and the old data set by “=Days” is displayed on the left side of the graph.

⑥ =Torque
The minimum value and the maximum value of the vertical axis can be set. “MIN” is the minimum value, and “MAX” is the maximum value.

⑦ =Axis
Removing the tick in the box hides the axis on the screen.

⑧ =Save CSV
Pressing the “CSV” button saves the variation and measured value into the external memory device as CSV format. As for the external device, it can be saved into both SD card and USB, but the data is priory save into the SD card. The followings are the name for a file and a folder to be saved.

File name: “the name which is set in the each setting window” + “year/month/day” + “hour/minute/second”. CSV
Folder name: “SR LIFE DIAGNOSIS”
8 System Setup
8.21 Preventive Maintenance Function

® =Hard COPY
Pressing the “®=Hard COPY” button saves the hard copy of the screen as JPG format into the USB memory stick.

The following is a name for the file.
File name: “year/month/day” + “hour/minute/second”. JPG

® =CLOSE
Pressing “®=CLOSE” button closes the graph window.

8.21.2.3 After Replacement of the Speed Reducer

The lifetime diagnosis does not perform correctly if use the old data after replacement of the speed reducer. Thus, reset the data for the lifetime diagnosis, and prevent using the data before replacement day.

Perform the following procedures after replacement of the speed reducer.

1. Change the security mode to the management mode.
2. Select {®=PM} in the main menu.
3. Select {®=PM(REDUCER)}.
4. Select {®=DISPLAY}, select the {®=LIFE CALCULATION} or {®=TORQUE MONITOR] in the pull down menu.
   – The lifetime calculation window or the torque monitor window appears.

![Image of lifetime calculation window or torque monitor window]
5. Move the cursor over the "Reset" on the axis window of which speed reducer is replaced, and press {Select}.
   – The confirmation dialog appears.

6. Select {YES}.
   – The data of its axis is reset, and the replacement day is recorded into the "=INSPECTION RECORD" window.
   – The operation is canceled when select "No".

The procedures above can be performed in the lifetime window or the torque monitor window.

The replacement day is recorded into the "INSPECTION RECORD" window by performing the procedures above.
8.21.3 Inspection Notice Function

The inspection notice function turns the notice signal ON and displays the message when the inspection time has come.

Perform the inspection by the authorized personnel or YASKAWA representative (the list on the back cover) when the notice signal is turned ON.

8.21.3.1 Setting Procedures

1. Change the security mode to the management mode.
2. Select {PM} in the main menu.
3. Select {INSPECTION NOTICE}.
   - The inspection notice window appears.
4. Select {DISPLAY} in the main menu.
   - {SETUP CONDITION} is displayed in the pull down menu.
5. Select (=SETUP CONDITION).
   – (=SETUP CONDITION) window appears.
     Modify each items if necessary.

Each item on the screen represents the following description.

① TIME
Before the remaining time to the inspection is "0", the message is shown and the inspection signal is ON at the time which is set in this item. For example, if "100" is set, the message is shown and the signal is ON 100 hours before the remaining time to the inspection is "0". The time can be set in the management mode.

② SIGNAL
Set the GP output number which notifies the inspection time.
8.21.3.2 The Inspection Notice Window

1. Select {=PM} in the main menu.
2. Select {=INSPECTION NOTICE}.

   – The inspection notice window appears.

Each item on the screen represents the following description.

① Inspection items
The contents of the inspection are shown. The contents differ depending on the model of manipulators. For details of the contents, refer to the manipulator’s instruction manual corresponding to the model.

② REMAINING
The remaining time to the inspection is shown. When the servo power is ON, the measurement automatically starts and the numeric value is reduced. When the value is “0” in this item, the inspection signal is turned ON and the message is shown.

③ INTERVAL
The time interval of the inspection is shown.

④ ESTIMATE
The estimated date for the inspection is shown.

When the inspection signal is turned ON or the message is displayed, perform the inspection by an authorized personnel or the YASKAWA representative (listed on the back cover of this instruction manual). The message is displayed continuously until the YRC1000micro is inspected.
8.21.4 Record of Inspection Date and Replacement Date

The dates when the inspection or the replacement was done can be checked by following procedures.

1. Select (=PM) in the main menu.
2. Select (=INSPECTION RECORD).
3. Select (DISPLAY), and select (=INSPECTION DATE) in the pull down menu.
   – The inspection date can be checked.

4. Select (DISPLAY), and select (=REPLACEMENT DATE) in the pull down menu.
   – The replacement date can be checked.
8.21.5 Management of the Data

According to the torque average value, such as the speed reducer preventive maintenance database, the preventive maintenance elements, the record of the inspection and replacement, can be loaded/saved into the external memory device.

As for the external device menu, refer to “YRC1000micro OPERATOR’S MANUAL (RE-CSO-A058) 7. External Memory Device” for more details.

1. Select {EX.MEMORY} in the main menu.
   – The external memory menu window appears.

2. Select {LOAD} or {SAVE}.
   – The load window or the save window appears.
3. Select the "SYSTEM DATA".
   - The system data selection window appears.
     (The following is an example of a window.)

4. Select the system data to load or save.
   - For the speed reducer preventive maintenance data base, select "=(PM(REDUCER)FILE)".
   - For the speed reducer preventive maintenance condition, select "=(PM(REDUCER)CONDITION)".
   - For the record of the inspection and replacement date, select "=(INSPECTION RECORD FILE)".
     The selected system data is displayed with " ★ ".

5. Press [Enter].
   - The confirmation dialog appears.

6. Select (YES)..
   - The selected system data is saved.
8.21 Preventive Maintenance Function

8.21.6 Preventive Maintenance for the Hardware

This function estimates the life span of the controller components by calculating the consumed amount with considering the usage environment and the load, and outputs GP signals to be the reference for the replacement time.

The function overview is described below.

8.21.6.1 Target Components for Diagnosis

Regarding the following, calculations of the consumed amount and outputs of the GP signals to be the reference for the replacement time are performed.

- Cooling fan*
- Capacitor
- Amplifier IGBT
- Contactor
- Motor (numbers of revolution and reverse revolution are displayed)

*Even though a fan is one of target components, some models do not have the fan. Refer to the INSTRUCTIONS for the each manipulator to confirm if it has the fan.

8.21.6.2 Replacement Time Display

- **Stepwise Display of Replacement Time**
  
  For each component, a judgment from A to D is displayed, and it can be used as the reference for the replacement time.

<table>
<thead>
<tr>
<th>Judgment display</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>New - Used about half of its life span</td>
</tr>
<tr>
<td>B</td>
<td>Used about half of its life span</td>
</tr>
<tr>
<td>C</td>
<td>Used about half of its life span - Time to replace (reference)</td>
</tr>
<tr>
<td>D</td>
<td>Time to replace (reference)</td>
</tr>
</tbody>
</table>

- **Signal Output of Replacement Time**
  
  If any of the components is judged as D, ON signal is output from the GP output which is set as “Alarm signal” of the file.

  However, only one signal for this GP signal can be output for one controller.
8 System Setup
8.21 Preventive Maintenance Function

- **Mask of Signal Output**
The GP output signals can be masked for each component.

If any of the components is judged as D, ON signal is output from the GP output which is set as "Alarm signal" of the file. This signal is output continuously, so the signal to inform the replacement time of the component cannot output newly. Therefore, the signal of the replacement time for other components can be output by masking the signal output of the component which is already judged as D and turning OFF the GP output signal temporarily. Even if the masking is performed, D remains to be displayed for the component judged that it should be replaced.

8.21.6.3 Replacement of Component

- **Record of Replacement Date of Component**
When the component is replaced, the replacement date (year, month, day) can be recorded. It can be used for the reference for the next replacement time or for the estimation of the failure mode by the failure time.

- **Life Span Setting at Replacement of Component**
A new component or an used one, whichever it is replaced with, the life span setting can be performed.

For the used component, after recording the replacement date, the value 1 - 100% can be set as the leftover life.

- **Display of the Numbers of Motor Revolution and Reverse Revolution**
The accumulated values are displayed regarding the number of each motor revolution and the number of reverse revolution of positive and negative revolution. They can be used as the reference for the replacement time of the speed reducer or motor.
8.21.7 Setting of Preventive Maintenance for the Hardware

8.21.7.1 Setting of Replacement Time Display

1. Select {PM} in the main menu.
   – The sub menu appears.

2. Select {PM (HARDWARE)}.
   – Alarm signal setting and unit selection window appears.
3. Input the numerical value of the alarm signal. When any of components in this controller comes to the replacement time, the GP output signal which is already set turns ON.

- * For example, 125 is input.

4. Select the unit. Or select the unit from {DISPLAY} in the menu.

- * For example, {COOLING FAN} is selected.
5. The following information is displayed:
   Starting from the left,
   (1) “●” is displayed when the replacement time is judged as D.
   (2) Component name
   (3) GP output signal valid/invalid
   (4) The first date of use
   (5) Leftover life judgment

   – When (COOLING FAN) is selected:

   ![COOLING FAN Image]

   – When (CAPACITOR) is selected:

   ![CAPACITOR Image]

   – When (AMPLIFIER IGBT) is selected:

   ![AMPLIFIER IGBT Image]
8 System Setup
8.2.1 Preventive Maintenance Function

– When (CONTACTOR) is selected:

6. When replaced with a new component, select “O”.

– A confirmation dialog box appears. When replaced with a new component, select (YES).
8 System Setup
8.21 Preventive Maintenance Function

7. When replaced with an used component, select {BEGINNING}.

   – A window to input the numerical value appears. Input the replacement date using half-width characters like {2009.3.14}. After that, a following confirmation dialog box appears. When replaced with an used component, select {YES}.

8. When manually setting the approximate value to the leftover life, input the numerical value "0 - 100%".

9. When the numerical value displayed in the confirmation dialog box is correct, select {YES}.
8.21.7.2 Mask of Replacement Time Display (Signal Display)

Perform the masking of the replacement time display according to the following procedures:

1. When any of the components comes to the replacement time, the message is displayed per unit.

   ![Image 1]

   ![Image 2]

2. The message is also displayed per component. Invalidate the output.
   - After checking the components, invalidate the output.
3. The GP output signal is turned OFF. And the message turns to be hidden. However, the stepwise display remains D.

* Before the replacement, perform the above operation in order to detect the multiple components because only one GP output of life diagnosis can be output for one controller. The masking cycle is as follows:
  Replacement time of a component, GP output ON, Checking the component and turning OFF the output of the component, GP output OFF, Replacement time of another component, GP output ON.
8.21.8 Display of the Numbers of Motor Revolution and Reverse Revolution

8.21.8.1 Display of the Numbers of Revolution and Reverse Revolution

1. Select each menu in the following order. {=PM} in the main menu, {PM(HARDWARE)}, {MOTOR}.

8.21.8.2 Percent Display of the Number of Motor Revolution

At the motor rated number of revolution, it displays how many percent it has operated with 100% representing the case it operates 20000 hours.

1. Select each menu in the following order. {PM} in the main menu, {PM(HARDWARE)}, {MOTOR}. And then select {DISPLAY} on the menu to select {REVOLUTION(%)}. 
8. System Setup

8.21 Preventive Maintenance Function

8.21.8.3 Resetting the Number of Revolution

Used when the motor replaced with a new one.

1. Select “O” of the axis to be reset by moving the cursor to it, and then select ‘YES’ on the dialog box.

The day of the first use (BEGINNING) is automatically changed.
8.21.8.4 Changing the Numbers of Revolution and Reverse Revolution

Used when the motor replaced with an used one.

1. Select the number of the axis to be reset by moving the cursor to it, and then set the number.
To set the day of the first use (BEGINNING), select the date of the axis to be reset by moving the cursor to it, and then set the date.

- * When changing the number of revolution.

- * When changing the number of reverse revolution.
8.22 Operating Status Monitor Function

With this function, the operating status of the manipulator (Operation time, IO waiting time, energy saving time, time for stopping by the alarm) can be checked. The status can be checked consecutively for 5 days if measured by the hour, for 100 days if measured by the day, for 60 months if measured by the month.

Graph of the Operating Status

The graph of the operating status is shown by the following steps.

1. Select {PM} in the main menu.
2. Select {OPERATING STATUS}.
   - The operating status window is shown.
3. Select {END}.
   - The initial window is shown again.

Each item on the screen represents the following description.

1. **OPERATE**
   Indicates the cumulative time for executing the move instruction.

2. **IO WAIT**
   Indicates the cumulative time for which the manipulator's operation is stopped by the WAIT instruction or etc.

3. **ENERG-SAVE**
   Indicates the cumulative time for which the servo power is OFF by the energy saving function.

4. **ALM.STOP**
   Indicates the cumulative time until the next start after the occurrence of the alarm.

5. **OTHERS**
   Indicates the time other than above items no.1 to no.4.
Set the range of horizontal axis of the graph

The range of horizontal axis can be changed by setting the numeric value.

**ITEM**

Select {ITEM} and the pull down menu is shown.

"ALL", "OPERATE", "IO WAIT", "ALM.STOP" or "OTHERS" are selectable.

- "ALL" is selected.
  OPERATE, IO WAIT, ALM.STOP and OTHERS are shown.
- "OPERATE" is selected.
  OPERATE only is shown.
- "IO WAIT" is selected.
  IO WAIT only is shown.
- "ALM.STOP" is selected.
  ALM.STOP only is shown.
- "OTHERS" is selected.
  OTHERS only is shown.

**UNIT**

Select {UNIT} and the pull down menu is shown.

"HOUR", "DAY", or "MONTH" are selectable.

- "HOUR" is selected.
  The unit of the horizontal axis of the graph is the hour.
  For the item no. 6, the value can be set in the range from -96 to 0.
- "DAY" is selected.
  The unit of the horizontal axis of the graph is the day.
  For the item no. 6, the value can be set in the range from -100 to -3.
- "MONTH" is selected.
  The unit of the horizontal axis of the graph is the month.
  For the item no. 6, the value can be set in the range from -60 to -3.

**UPDATE**

By pressing "UPDATE", the data can be updated.

**HARD COPY**

By pressing "HARD COPY", the hard copy on the window can be save into the USB memory stick as a JPG format. The file name to be saved is the following.

File name: "year/month/date"_"hour/minute/second".JPG

**END**

By pressing "END", the graph window is closed.
With this function, the following items are shown. The number of job execution, the playback time, the moving time, the IO stop time, the energy saving time, the load ratio of each axis for each job.

**Job Registration**

For the job registered on the JOB MONITOR ENTRY window, the measurement is performed. A job is registered by the following steps. The maximum 10 jobs can be registered.

1. Select (=PM) in the main menu.
2. Select (JOB MONITOR).
   - The JOB MONITOR window is shown.

3. Select (DATA).
   - The pull down menu is shown.
4. Select (JOB MONITOR ENTRY).
   – The JOB MONITOR ENTRY window is shown.

5. Job registration
   (1) The maximum 10 jobs can be registered. Move the cursor to the desired number and press [SELECT]. The job name window is shown. (If the number in which the job has already registered is selected, the dialog “Clear data?” shows up. Select (YES).)

   (2) Move to the desired job and press [SELECT]. The job is registered in the JOB MONITOR ENTRY window.
8 System Setup
8.23 Job Monitor Function

Measurement of Data
When the playback is performed for the job registered in the JOB MONITOR ENTRY window, measurement automatically starts. The data is automatically updated every time the playback is performed. Measurement is performed for the section from NOP to END or RET of the registered job. And if the hold, the emergency stop or the alarm occurs during measurement, the measurement ends. Also, if 600 seconds pass after starting the measurement and the conditions mentioned above are not satisfied, the measurement ends.

Following examples show the timing when measurement ends and the data is updated.

<Example 1> No RET in the section
TEST1.JBI
NOP → measurement starts
MOVJ
MOVJ :
:
END → measurement ends

<Example 2> RET in the section
TEST2.JBI
NOP → measurement starts
MOVJ :
RET → measurement ends :
END

<Example 3> The hold, the emergency stop or the alarm stop occurs during measurement.
TEST1.JBI
NOP → measurement starts
MOVJ
MOVJ → measurement ends
(The hold, the emergency stop or the alarm stop occurs)
:
END
8 System Setup
8.23 Job Monitor Function

<Example 4> The registered job (TEST1.JBI) calls another registered job (TEST2.JBI) by CALL instruction or etc.

TEST1.JBI
NOP → measurement starts
MOVJ
MOVJ
CALL JOB: TEST2
:
END → measurement starts

In this case, the job monitor data of TEST2 is not updated.

- Data Check
The number of job execution, playback time, moving time, IO stop time, energy saving time are shown. Also, the lifetime of the speed reducer, the load ratio, the maximum speed, the average speed, the maximum torque and the average torque of each axes are shown.

The data can be checked by following steps.
1. Select (=PM) in the main menu.
2. Select (JOB MONITOR).
   - The JOB MONITOR window is shown

3. Press {PAGE}.
   - It is possible to check the data of the date whose number corresponds to the number of pressing {PAGE}. Modify if necessary. The data of the current day is updated with the latest data every time a job is executed. For the previous data, the average values of the day are shown. The data of the maximum 50 days can be checked.
4. Move the cursor to the desired job name and press (OPEN).

- The JOB DIAGNOSIS window is shown. The lifetime of the speed reducer, the load ratio, the maximum speed, the average speed, the maximum torque and the average torque of each axes are shown.

- It is possible to check the data of the date whose number corresponds to the number of pressing (PAGE). Modify if necessary. The data of the current day is updated with the latest data every time a job is executed. For the previous data, the average values of the day are shown. The data of the maximum 50 days can be checked.

5. Press (CLOSE).

- The JOB MONITOR window is shown again.
Management of Data

The job monitor data can be saved by the external memory menu. For details of the external memory menu, refer to "YRC1000micro OPERATOR'S MANUAL (RE-CSO-A058) 7. External Memory Devices".

1. Select {EX.MEMORY} in the main menu.
2. Select {SAVE}.
3. Select "SYSTEM DATA".
4. Select "JOB MONITOR DATA".
   The selected system data is displayed with "★".
5. Press [ENTER].
6. Select {YES}.
   - "JOB MONITOR DATA" is saved.
8.24 Robot Monitor Function

With this function, the threshold values are set for the following items. Torque, collision detect external force value, speed FB, and error pulse. When the values is equal to the threshold values or more, the GP output signal is turned ON.

**Setting the threshold value and GP output signal**
Perform the setting of the threshold value and GP output signal in accordance with the following procedure. The data can be checked by following steps.

1. Select (=PM) in the main menu.
2. Select (ROBOT MONITOR).
   - The ROBOT MONITOR window is shown

   ![ROBOT MONITOR Window]

3. Set the “CONTROL GOUPL”.
   - Select the control group in the pull down menu.
4. Set the “ITEM”.
   - Select the item (Torque, collision detect external value, speed FB, error pulse) in the pull down menu.
5. Set the threshold value.
   - Move the cursor to “VALUE” of the desired axis and input the threshold value.
6. Set the GP output number.
   - Move the cursor to “OUT#” of the desired axis and input the GP output number.
Management of Data
The robot monitor data can be saved by the external memory menu. For details of the external memory menu, refer to “YRC1000micro OPERATOR'S MANUAL (RE-CSO-A058) 7. External Memory Devices”.

1. Select {EX.MEMORY} in the main menu.
2. Select {LOAD} or {SAVE}.
   – The LOAD or SAVE window is shown.
3. Select “SYSTEM DATA”.
4. Select “ROBOT MONITOR DATA”.
   The selected system data is displayed with "★".
5. Press [ENTER].
6. Select {YES}.
   – “ROBOT MONITOR DATA” is saved.
8.25 Brake Line Ground Judgment Function

8.25.1 About the brake Line Ground Judgment Function

If the current flowing through the brake line exceeds the capacity of the control power supply unit, the DC 24V power supply will be disconnected by the protective circuit of the control power supply unit; then an alarm “1683 DC24V POWER SUPPLY FAILURE(SV)” occurs. This function identifies the position where the ground fault occurred after arising the alarm “1683 DC24V POWER SUPPLY FAILURE(SV)”. It is able to identify which axis brake line does the ground fault occur by inspecting the each axis from the programming pendant.

Identify the ground fault of the brake line by the following methods.

(1) Turn the servo ON the group which the ground fault occurs.

(2) Discharge the any axis brake, and then confirm if the DC 24V power supply will be disconnected.

8.25.2 Operating Condition

1. Condition of the controller
   The controller has restarted normally by restarting the controller after arising the alarm “1683 DC24V POWER SUPPLY FAILURE(SV)”.

2. Mode
   Only teach mode

3. Security
   All security mode, such as Operation, Edit and Management mode

4. Others
   • Must be SERVO OFF
   • The emergency signal is not input (Pendant, controller, external signal)
8.25.3 Operation

8.25.3.1 Occurrence of a DC 24V Power Supply Failure (SERVO)

– When detecting either the ground fault or the short circuit of the brake line, the alarm "1683 DC24V POWER SUPPLY FAILURE(SV)" occurs.

– Restart the control power, and perform the brake line ground check.

8.25.3.2 Brake Line Ground Check

1. Select (BRAKE LINE GROUND CHECK) in the sub-menu from (ROBOT) in the main menu.
2. Press {YES}.
   - The confirmation dialog appears due to prevent the mis-operation.
   - Select {YES}, then the brake line ground check appears.
   - Select {NO}, the window returns to the previous window.

3. Move the cursor over the axis to perform the brake line ground check, and press [SERVO ON READY]. Grip the enable switch and long press [SELECT] while pressing down the [INTER LOCK] to perform the brake line ground check.
   - Perform the brake line ground check to the every single axis displayed on the screen.
   - The brake line ground check is canceled in the case of following conditions.
     - [SELECT] operation is released.
     - The emergency button of the programming pendant or external signal is pressed.
     - Enable switch is released or gripped further.
     - The servo alarm occurs.
8 System Setup
8.25 Brake Line Ground Judgment Function

JUDGEMENT REQUIRED: The ground check is not performed

BRAKES LINE NORMAL: The brake line is normal.

DETECTED GROUND: The ground fault or short circuit of the brake line

ABNORMAL END: The ground check is canceled. (i.e. the dislocation of the axis is detected, and so on)

4. Detecting the Brake Line Ground Fault

– When the brake line ground fault or the short circuit is detected, the alarm “1694 GROUND FAULT (BRAKE LINE)” occurs.
– Inspect the brake line of the axis which raised the alarm.
– Restart the control power, and perform the brake line ground check to the rest of the axes.

8.25.3.3 Initializing the Related Information

1. The sub menu {BRAKE LINE GROUND CHECK} appears after selecting the {ROBOT} in the main menu.

2. Select {DATA} in the menu.

– The pull-down menu appears.
3. Select {CLEAR}.
   - The confirmation dialog appears.

4. Press {YES}.
   - The related information of the brake line ground check is initialized.
   - {BRAKE LINE GROUND CHECK} does not appear in the main menu until the alarm “1683 DC24V POWER SUPPLY FAILURE(SV)” occurs.
8.26 Safety Logic Circuit

8.26.1 Outline

The safety logic circuit is a function to create a safety logic circuit by the programming pendant. It enables to set up the logical operations, such as stopping the manipulator and outputting the servo ON signal.

The contents of this function are described below, however, the GP safety I/O board which is the optional board is required to prevent losing the safety function.

If a logic (AND, OR, etc.) is performed by using non-safety data and another safety signal without using the GP safety I/O board which is the optional board, the output result will be non-safety data.

If non-safety data is used for an application in which safety is required, the safety function will not be maintained. Thus, make sure to properly perform a risk evaluation of the robot system before using non-safety data.

The followings are the contents of this function.

- Executes the safety logic circuit by the safety circuit board corresponded to the secure authentication.
- The safety logic circuit consists of the system section and the user section.
- The system section of the safety logic circuit is the specific circuit of YASKAWA, so that the safety logic circuit cannot be edited. Meanwhile, for the user part, it is possible to edit.
- Both system and user section of the safety logic circuit consist of a circuit with 2 inputs and 1 output or a circuit with 1 input and 1 output.
- Both system and user section of the safety logic circuit consist of 128 lines.
- Both system and user section of the safety logic circuit are operated in every 2 ms cycle.
- Both system and user section of the safety logic circuit can be referred by the all modes regardless the security mode, however the user section can be edit only when the security mode is “SAFETY MODE” plus under the teach mode and the servo is OFF.
Following is the example of configuration with the safety PLC.

For the connection of the Extension GP Safety I/O board (optional), the board of JANCD-ASF32-1E (8 points available) can be connected to each safety circuit board (JANCD-ASF30-1E).
8.26.2 Changing the Security Mode

To create/edit the safety logic circuit, change the security mode to the safety mode.

1. Display of the window.
   - Select {SECURITY} from {SYSTEM INFO} in the main menu.

2. Change to the safety mode.
   - Select {SAFETY MODE}.
   - Enter the password for the safety mode, and then press [ENTER].
– When the entered password is correct, the mode is changed to {SAFETY MODE}. After changing to the safety mode, the icon on the status area is changed to .

NOTE

For the key pad of the numerical input, display (available) and hide (non-available) can be switched by selecting the "DISPLAY SETTING" in the main menu shown on the programming pendant. At factory setting, the key pad is set as display (available).
8.26.3 Available I/O Signals and Instructions in Safety Logic Circuit

The following is the explanation of the input and output signals and logic (instructions) available in the safety logic circuit.

<table>

5. **Comment**

It is possible to input up to 32 characters in one-byte (16 characters in two-byte).
8.26.3.1 Switching Display of System and User Section

1. Operation for switching display.
   By pressing [PAGE] shown on the programming pendant and selecting the USER or SYSTEM, the display of the system and user section of the safety logic circuit can be switched.

   SYSTEM: The system section of the safety logic circuit is shown.
   USER: The user section of the safety logic circuit is shown.

2. Display of the system section.
   (SYSTEM) is shown in the title line while the system section is shown.

   For the display of the system section (SYSTEM) is shown in the title line.
3. Display of the user section. There is no message next to STS in the title line while the user section is shown.

For the display of the user section No message is shown next to STS in the title line.

There is a case that the system section of the safety logic circuit is not defined at factory setting.
8.26 Safety Logic Circuit

8.26.4 Safety Logic Circuit

1. Display of the window.
   - Select {SAFETY LOGIC CIRCUIT} from {SAFETY FUNC.} in the main menu.

2. Create the safety logic circuit
   - Create the safety logic circuit. The setting items are "INPUT1", "LOGIC", "INPUT2" and "OUTPUT".
     Set "TIMER" and "COMMENT" if necessary.
   - The INPUT1 and INPUT2 must be set.
   - When setting the input 1 or 2, LOGIC is also must to be set.
   - OUTPUT is also must be set. The same output signal cannot be set to the multiple logic circuit.
After creating the safety logic circuit, the status changes from “DONE” to “NOT DONE”. The “WRITE” button is shown on the left down corner of the screen.

3. Canceling the edit
   – To start over the editing, select {CANCEL EDIT} from {EDIT} in the pull-down menu.
8 System Setup
8.26 Safety Logic Circuit

4. Line clear
   - To clear the one line, select {LINE CLEAR} from {EDIT} in the pull-down menu.

5. All line clear
   - To clear the all line, select {ALL LINE CLEAR} from {EDIT} in the pull-down menu.
6. Copy

- Choose the desired area to make a copy, and select {COPY} from {EDIT} in the pull-down menu.

- Go to the area to paste, select {PASTE} from {EDIT} in the main menu to paste.
7. Transferring and updating the safety logic circuit file

(1) After creating the safety logic circuit, select {WRITE}.

– The safety logic circuit file is transferred to the safety circuit board. If there is a blank line in the safety logic board, it will be filled automatically.

– When the transfer of the safety logic circuit file is successfully performed, the following window is shown.

(2) When {CONFIRM} shown on the programming pendant is selected, the confirmation dialog of “Update the file?” is shown.
8 System Setup
8.26 Safety Logic Circuit

(3) Press {YES}, and then the file transferred to the safety circuit board is written in the FLASH ROM. The status becomes "DONE" from "NOT DONE".

If press {NO}, the file will not be updated. The status remains "NOT DONE".

- If press {YES}, on the confirmation dialog, the all information related to the safety logic circuit is transferred to the safety circuit board as the safety logic circuit file and written in the FLASH ROM of the safety circuit board.
- If select {WRITE}, the all output signals output from the safety circuit board are turned OFF until the writing process is completed.
8. Execution of the safety logic circuit

- When the write operation is completed, the safety logic circuit is executed. If the set signal is ON, "●" is shown. If the set signal is OFF, "○" is shown. The safety logic circuit is always executed except the write operation.
8.26.5 Signal List Window

The ON/OFF status list of the signals used in the safety logic circuit is shown.

1. Select {SAFETY FUNC.}- {SLC SIGNAL DISPLAY}

2. The signals used in the safety logic circuit is shown..
8.26.6 Setting ON/OFF to the Input Signals

The display of the ON/OFF status of input signals used in the safety logic circuit can be switched.

1. Select (SAFETY FUNC.)-(SLC SIGNAL DISPLAY SET).

2. The ON/OFF status of input signals used in the safety logic circuit can be switched by pressing [SELECT] on the programming pendant.
### 8.26 Safety Logic Circuit

3. For example, when the EXESP signal is changed from "Normal Open" to "Normal Close", the mark "●" indicates the external emergency stop signal is in the normal state (Normal Close) and the mark "〇" indicates the external emergency stop signal is being input (Normal Open).

<table>
<thead>
<tr>
<th>No.</th>
<th>Signal Name</th>
<th>Normal Open</th>
<th>Normal Close</th>
</tr>
</thead>
</table>
| 1   | EXESP       | External emergency stop input signal  
        (●: Under emergency stop/ 〇: Normal) | External emergency stop input signal  
        (●: Normal/ 〇: Under emergency stop) |
| 2   | FSBIN       | GP safety input signal (ASF32)  
        (●: OFF [release]/ 〇: ON [short circuit]) | GP safety input signal (ASF32)  
        (●: ON [short circuit]/ 〇: OFF [release]) |
| 3   | HOLD        | Hold  
        (●: ON (Hold signal is being input)/ 〇: ON (Hold signal is not input)) | Hold  
        (●: OFF (Hold signal is not input)/ 〇: ON (Hold signal is being input)) |
| 4   | PPDSW       | Programming pendant enable switch signal  
        (●: Grip/ 〇: Not grip (servo OFF)) | Programming pendant enable switch signal  
        (●: Not grip (servo OFF)/ 〇: Grip) |
| 5   | PPESP       | Programming pendant emergency stop signal  
        (●: Under emergency stop/ 〇: Normal) | Programming pendant emergency stop signal  
        (●: Normal/ 〇: Under emergency stop) |
| 6   | SAFF        | Safety fence signal  
        (●: Open (safety fence opened)/ 〇: Close) | Safety fence signal  
        (●: Close/ 〇: Open (safety fence opened)) |
4. Select (WRITE) and then (CONFIRM) to enable the changed settings. When the data is updated correctly, the status on the title line is changed from "NOT DONE" to "DONE".

NOTE
When the ON/OFF settings of the input signals are changed, outputting the signals that have been output normally may fail. This may lead to a serious accident. After changing the ON/OFF settings of the input signals, be sure to confirm the safety logic circuit operates normally.
8.26.7 Setting for the GP Safety I/O Signals

8.26.7.1 Preliminary setting for the GP Safety I/O Signal

When using the GP safety I/O signal (type: ASF32 board), start up the maintenance mode and perform the following operations.

1. Display of the window
   – Turn the power ON while pressing [MAIN MENU] on the programming pendant.

2. Change the security
   – When the maintenance mode is started, Select {SECURITY} from {SYSTEM}.

3. Change to the safety mode.
   (1) Select {SAFETY MODE}.
   (2) Input the password for the safety mode and press [ENTER].

4. When the correct password is input, the mode is changed to {SAFETY MODE}.
   – After changing to the safety mode, the icon shown on the status area is changed to .

5. After changing the security, select each menu in the following order. {SYSTEM},{SETUP},{OPTION FUNCTION},{SAFETY I/O BOARD SETTING}. 

![Diagram of the system setup process]
6. Press [SELECT] on the programming pendant and set the GP safety I/O board ASF32.

![Image of programming pendant showing safety logic circuit settings]

NOT USED: GP safety I/O board is not used.

JANCD-ASF32-1E: The I/O 8 points of GP safety I/O signal are available.

**NOTICE**

- When starting up the robot system, confirm the function and wiring of the general-purpose safety I/O signals.

7. Press [ENTER] on the programming pendant and select {YES}. The data is updated.

![Image of programming pendant showing modification confirmation]

8-250
8. After updating the data, select in the following order. 
   `{FILE}`, `{INITIALIZE}`, “Safety Board FLASH Reset”.
   - When “bleep” sounds, the initialization is completed and the 
     message on the programming pendant disappears. Also, if the 
     message “Select ‘Safety Board FLASH reset’” is shown on the 
     message area of the programming pendant, perform “Safety Board 
     FLASH reset”.

9. Turn OFF/ON the YRC1000micro.
8.26.7.2 Setting for the GP Safety Output Signals

1. Select (SAFETY FUNC.)-{F-SAFETY SIGNAL ALLOC}.
   - The following window is shown. The mark at the center of the window indicates ON/OFF status. "○" means OFF and "●" means ON.

2. To use the GP safety output signals in the safety logic circuit, press [SELECT] on the programming pendant and set "M-SAFE".
   - The GP safety output signals allocated to "M-SAFE" are available in the safety logic circuit. However, if the setting is "NOT USED", the signals are available only on the functional safety circuit board.
3. Select (WRITE) and then (CONFIRM) to enable the changed settings.
   - When the data is updated correctly, the status on the title line is changed from "NOT DONE" to "DONE".
8.26.8 Timer Delay

Set up the delay time of the output signal to use by the safety logic circuit. In the TIMER DELAY, there are "ON DELAY TIME" to delay the ON output and "OFF DELAY TIME" to delay the OFF output. It can be four timer settings.

When setting the 500 msec to ON DELAY TIME,

When setting the 300 msec to OFF DELAY TIME,

The initial value is 100(25 × 4)[msec].

It is able to set every 4msec up to 399,996 (99,999 × 25)[msec].
1. Displaying the window.

   - Select \{TIMER DELAY\} from \{SAFETY FUNC.\} in the main menu.

2. Set up the delay time.

   - Set the value of the delay timer to use.
   After the setting, the status changes from “DONE” to “NOT DONE”.
   \{WRITE\} is shown on the left down corner of the screen.
3. Canceling the edit

- To start over the editing, select {CANCEL EDIT} from {EDIT} in the pull-down menu.

4. Transferring or updating the file

- After editing, select {WRITE}. The file is transferred to the safety circuit board. When the file transfer is done correctly, the confirmation dialog "Update the file?" appears.
- Press {YES}, and then the file is updated. The safety logic circuit file which has been transferred to the safety circuit board is written in the FLASH ROM. The status becomes "DONE" from "NOT DONE".

• If press {YES}, on the confirmation dialog, the all information related to the safety logic circuit is transferred as the safety logic circuit file to the safety circuit board and written in the FLASH ROM of the safety circuit board.

• If select {WRITE}, the all ou tput signals output from the safety circuit board are turned OFF until the writing process is completed.
Set the width of the pulse output from the safety logic circuit by TIMER. When the GP safety input signal is ON, one-second one-shot signal is output from the GP safety output signal.

1. Select {SAFETY FUNC.}-{TIMER DELAY}.

2. Select {PAGE}-{TIMER}.
3. Input “250” at TIMER1.

4. Create the following safety logic circuit.

```
001  DSU  #1FSBIN1  #1FSBOUT1  TMR1
```

5. When the edit is done, select (WRITE).

   - The safety logic circuit file is transferred to the safety circuit board.

6. If the transfer is correctly done, the confirmation dialog “Update the file?” shows up. Select (YES).

   - The safety logic circuit file is updated.
   - The safety logic circuit file which has been transferred to the safety circuit board is written in the FLASH ROM. The status becomes “DONE” from “NOT DONE”.

   - If press (YES), on the confirmation dialog, the all information related to the safety logic circuit is transferred as the safety logic circuit file to the safety circuit board and written in the FLASH ROM of the safety circuit board.
   - If select (WRITE), the all output signals output from the safety circuit board are turned OFF until the writing process is completed.
8.26.10 Output Signal

The following signals can either be hard-wired or be controlled by the safety logic circuit.

<table>
<thead>
<tr>
<th>Expanded signal name</th>
<th>Hard-wired signal name</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| S-EXDSW               | None                   | - This is the external enable switch signal and functions only in the teach mode. 
  - When both the S-EXDSW signal and the enable switch on the programming pendant are ON, the servo power can be turned ON. 
  - When the S-EXDSW signal is not used in the safety logic circuit, the safety circuit board regards this as the short-circuit status. |
| S-EXESP               | EXESP                  | - This is the external emergency stop input signal. 
  - When the S-EXDSW signal is turned OFF, the signal performs the same control as the EXESP signal is turned OFF. 
  - The hard-wired EXESP signal is always monitored. When either the EXESP signal or the S-EXESP signal is OFF, the servo power supply is turned OFF. 
  - When the S-EXESP signal is not used in the safety logic circuit, the safety circuit board regards this as the short-circuit status. |
| S-FST                 | None                   | - This is the full speed signal. 
  - When this signal is turned ON in the teach mode, the manipulator's operation speed can be increased to 100%. |
| S-SAFF                | SAFF                   | - This is the safety fence signal and functions only in the play mode. 
  - When the S-SAFF signal is turned OFF, the signal performs the same control as the SAFF signal. The hard-wired SAFF signal is always monitored. When either the SAFF signal or the S-SAFF signal is OFF, the servo power supply is turned OFF. |
| MS-OUT                | None                   | This is the data to transfer the data created in the safety logic circuit to the functional safety function (optional). |

NOTE: The signals which has been controlled by a hardware are also always monitored. Thus, the safety function, which turns OFF the servo power supply when the error is detected, is maintained.
8.26.11 Display of the Message on the Programming Pendant

When the signals input by hard-wired or the request stop from the safety logic circuit stop the manipulator's operation, the messages on the programming pendant are changed as in the following table to recognize which signal stops the manipulator.

<table>
<thead>
<tr>
<th>Signal name</th>
<th>Message on the programming pendant</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>-</td>
</tr>
<tr>
<td>S-FST</td>
<td>Full-speed test mode. (Safety Logical Circuit)</td>
</tr>
<tr>
<td>EXESP</td>
<td>Robot is stopped by external emergency stop.</td>
</tr>
<tr>
<td>S-EXESP</td>
<td>Robot is stopped by external emergency stop. (Safety Logical Circuit)</td>
</tr>
<tr>
<td>None</td>
<td>-</td>
</tr>
<tr>
<td>S-EXDSW</td>
<td>EXDSW signal is OFF. (Safety Logical Circuit)</td>
</tr>
<tr>
<td>SAFF</td>
<td>Safety fence is open.</td>
</tr>
<tr>
<td>S-SAFF</td>
<td>Safety fence is open. (Safety Logical Circuit)</td>
</tr>
</tbody>
</table>

(Note) The upper line: the message when the manipulator is stopped by the input of the hard-wired signal.

The lower line: the message when the manipulator is stopped by the signals input from the safety logic circuit.

None: The appropriate signals do not exist.
8.26.12 Specific Input Signals Allocated to SPIN[xx]

32 signals input in the SPIN[xx] are allocated to specific input signals #40780 to #40817. The signals input in the SPIN[xx] are available in the safety logic circuit.

### WARNING

- SPIN is non-safety data. If a logic (AND, OR, etc.) is performed by using SPIN and another safety signal, the output result will be non-safety data. If SPIN is used for an application in which safety is required, the safety function will not be maintained. Thus, make sure to properly perform a risk evaluation of the robot system before using SPIN.
### 8.26 Safety Logic Circuit

#### 8.26.13 Output to the Control Status Signal

The following signals used in the safety logic circuit can be confirmed in the control status signals.

1. MS-OUT[64]
2. FS-OUT[64]
3. #n FSBIN[8]
4. #n FSBOUT[8]
5. #n PFLIN[32]
6. #n PFLOUT[32]

8 System Setup
8.26 Safety Logic Circuit

8.26.14 Saving or Loading the File

8.26.14.1 Saving the File

The safety logic circuit file can be saved into the SD card/USB memory stick of the programming pendant or the USB memory stick of the CPU board. Make sure the medium is inserted into the device of the save destination. Perform the following operations.

1. Display of the window.
   – Select each menu in the following order. (EX. MEMORY), (SAVE), (I/O DATA).

2. The signal list relative to the I/O data is displayed, and then select “YSF LOGIC FILE”.

3. The confirmation dialog appears, and select {YES}.

4. The safety logic circuit file (file name: YSFLOGIC.DAT) is saved in the specified device.
8.26.14.2 Loading the File

The safety logic circuit file can be loaded from the SD card/USB memory stick of the programming pendant or the USB memory stick of the CPU board. Make sure the medium is inserted into the device of the load destination. Perform the following operations.

1. Display of the window.
   - Select each menu in the following order.
     {EX. MEMORY}, {LOAD}, {I/O DATA}.

2. The signal list relative to the I/O data is displayed, and then select "YSF LOGIC FILE".

3. The confirmation dialog appears, and select {YES}.

4. The safety logic circuit file (file name:YSFLOGIC.DAT) is loaded from the specified device.

**NOTE**
When the safety logic circuit file is loaded, the file is not transferred to the safety circuit board. Select {WRITE} on the safety logic circuit window, and the file is written in the FLASH ROM of the safety circuit board. After the writing, the file is executed.
8.26.15 Initializing the Safety Logic Circuit File

If the following alarm is shown when starting the YRC1000 micro, the mode is changed to the management mode. The alarm occurs when the file does not match the file written in the FLASH ROM of the safety circuit board.

For example, if the safety circuit board is replaced with the spared part, the following alarm will occur.

When the alarm occurs, perform the following procedures to restore.

8.26.15.1 Initializing the Safety Logic Circuit File

1. Display the window.
   – Select {SECURITY} from {SYSTEM} in the main menu.
2. Change the security.
   (1) Select {SAFETY MODE}.
(2) Enter the password for the safety mode, and press \{ENTER\}.

3. When the entered password is correct, the mode is changed to \{SAFETY MODE\}.
   - After changing to the safety mode, the icon shown on the status area becomes 

![Diagram showing the status area change]
4. Select the file to be initialized.
   
   (1) Select each menu in the following order. 
   \{(FILE), \{INITIALIZE\}, \{I/O DATA\}\.
   
   (2) The I/O data file list is shown, and then select "YSF LOGIC FILE".

![File List](image1)

5. Perform the initialization.
   
   (1) Select \{ENTER\}.
   
   – The confirmation dialog appears.

![Confirmation Dialog](image2)

(2) Select \{YES\}.

– The file written in the FLASH ROM of the safety circuit board is initialized.

![Initialization Confirmation](image3)
8.26.15.2 Safety Circuit Board FLASH ROM Data Erase and Reset

A safety logic circuit file written in the FLASH ROM of the safety circuit board can be cleared. After erasing, a safety logic circuit file can be transferred to the safety circuit board and written in the FLASH ROM. These clear/reset operations are explained in the following.

### Safety Circuit Board FLASH ROM Data Erase

1. Display of the window.

   (1) Select each menu in the following order. (FILE), (INITIALIZE), (Safety Circuit Board FLASH Erase).

   ![Menu Screen](image.png)

   (2) The confirmation dialog appears, and select (YES).

      - The safety logic circuit file written in the FLASH ROM of the safety circuit board is cleared.

### Note

After performing the “Safety Circuit Board FLASH Erase”, and turning the YRC1000micro power supply ON/OFF. Next time when turning the power supply ON, the alarm “0300: VERIFY ERROR (SYSTEM CONFIG-DATA) [10]” occurs.

Therefore, when performing the “Safety Circuit Board FLASH Erase”, the “Safety FLASH Restart” needs to be performed as well.
Safety FLASH Reset

1. Displaying the window.

   (1) Select each menu in the following order.
       {FILE}, {INITIALIZE}, {Safety Circuit Board FLASH Reset}

       ![Diagram of the window]

   (2) The confirmation dialog appears, and select (YES).

       – The safety logic circuit file is transferred and written in the FLASH ROM of the safety circuit board.
8.26.16 Example of Safety Logic Circuit

The followings are the examples of the safety logic circuit.

<The safety logic circuit: example 1>

This is the example of the setting to output from the GP safety output signal1(#1 FSBOUT1) while the GP safety input signal1(#1 FSBIN1) is ON and also 2(#2 FSBIN2) is ON.

1. The following safety logic circuit is created.
   • Signal1: GP safety input signal1(#1 FSBIN1)
   • Signal2: GP safety input signal2(#2 FSBIN2)
   • Logic: AND
   • Output signal: GP safety output signal1(#1 FSBOUT1)

2. The time chart is shown.

   #1 FSBIN1 is ON and #1 FSBIN2 is ON
   So that #1 FSBOUT1 is ON
3. Verifying the safety logic circuit.
   Switch ON the GP safety signal “1” and “2”.
   The mark “○” becomes “●”.

   <The safety logic circuit: example 2>
   In the following example, one second after the emergency button of the
   programming pendant (PPESP) is pressed and the GP safety input
   signal1 is OFF, the GP safety output signal1(#1 FSBOUT1) is turned ON.

   1. The following safety logic circuit is created.
      • Signal 1 : Programming pendant emergency stop (PPESP)
      • Signal 2 : NOT GP safety input signal 1
                    (#1 FSBIN1)
      • Logic : AND
      • Output signal : GP safety output signal 1
                    (#1 FSBOUT1)
      • Timer : ON delay timer1 (TM1 ON DELAY) 1 second
2. The time chart is shown.

3. Verifying the safety logic circuit. Confirm that the mark “○” becomes “●” when pressing the programming pendant and switching the GP safety signal ON. The mark “○” of the GP safety output signal 1 becomes “●” after one second passed.
In the following example, when the GP safety input signal 1 (#1 FSBIN1) is ON under the teaching mode, the manipulator decelerates and stops its operation.

1. The following safety logic circuit is created.
   - Signal 1: Teach mode (TEACH)
   - Signal 2: GP safety input signal 1 (#1 FSBIN1)
   - Logic: AND
   - Output signal: Manipulator deceleration to a stop (SVOFF CAT1)

2. The time chart is shown.

#1 FSBIN1 is ON under the teach mode so that the servo will be turned OFF after the decelerating processing.
3. Verifying the safety logic circuit.
Set up the teach mode, and turn the servo ON. After that, when the GP safety signal 1 is turned ON, the mark "○" becomes "●" and the manipulator decelerates and stops its operation. If the manipulator stops its operation by the safety logic circuit, the message "Robot is stopped by safety logic circuit" is shown on the message area of the programming pendant.

NOTE
For the safety logic circuit of the YRC1000micro, even if the manipulator deceleration to a stop (SVOFF CAT1) is turned ON, the manipulator stops its operation instantly without decelerating. Under the play mode, if the manipulator deceleration to a stop (SVOFF CAT1) is turned ON, the manipulator decelerates and stops its operation.

NOTE
When the manipulator is stopped by the safety logic circuit signal, "Robot is stopped by safety logic circuit" is shown on the message area of the programming pendant. The control status signal #80343(Robot stopped by safety logic circuit) is turned ON.
The safety logic circuit: example 4>

The setting example by using the auxiliary relay is described below. While either status of the programming pendant emergency stop (PPESP), safety fence (SAFF) or external emergency stop (EXESP) is stopped, the GP safety output signal 1 (#1 FSBOUT1) is turned ON.

1. The following safety logic circuit is created
   - **Signal 1**: Programming pendant emergency stop (PPESP)
   - **Signal 2**: Safety fence (SAFF)
   - **Signal 3**: External emergency stop (EXESP)
   - **Logic**: OR
   - **Output signal**: GP safety output signal 1 (#1 FSBOUT1)
     The display of “#1 FSBOUT1” indicates "FSBOUT1" of the first safety circuit board connected to the first safety board.

2. The time chart is shown.

One of these status is ON, and #1 FSBOUT1 is ON.
3. Verifying the safety logic circuit.
When either the programming pendant emergency stop, safety fence, or the external emergency stop is input, the mark “○” of the GP safety output signal 1 becomes “●”.

![Safety Logic Circuit Table]

<The safety logic circuit: example 5>
The one-second one-shot output signal is created by the safety logic circuit. In the following example, the GP safety output signal (#1 FSBOUT1) is ON for one second.

1. Select {SAFETY FUNC.} - {TIMER DELAY}.

![Timer Delay Setting]

---

8 System Setup
8.26 Safety Logic Circuit
8 System Setup
8.26 Safety Logic Circuit

2. Select {PAGE} - (TIMER).

3. Input “250” at TIMER1.

4. Create the following safety logic circuit.
   001 DSU #1FSBIN1 #1 FSBOU1 TMR1
8 System Setup
8.26 Safety Logic Circuit

- When #1 FSBIN 1 signal is turned ON, #1 FSOUT 1 is ON for one second.

---

5. Select {WRITE} and then {CONFIRM} to enable the changed settings.

- When the data is updated correctly, the status on the title line is changed from "NOT DONE" to "DONE".

**NOTE**

When using the DSU/DSD instruction, the timer (TMR) must be set to the output signal. If {WRITE} is pressed without setting the timer (TMR) to the output signal, the error message “ERROR 4241: Safety logic circuit is not set correctly” is shown on the message area of the programming pendant.
The following is the setting example of the one-second one-shot output signal when two signals are turned ON at the same time.

1. The following safety logic circuit is created.

   001 DSU #1 FSBIN1 AND DSU #1 FSBIN2 #1 FSBOUT1 TMR1

2. Select {WRITE} and then {CONFIRM} to enable the changed settings. When the data is updated correctly, the status on the title line is changed from "NOT DONE" to "DONE".

   NOTICE
   • When using the DSU or DSD instruction, the signal status turns to "" only for 4 ms while the conditions are satisfied, but it is too short for visual check. Thus, display chapter 8.26.5 “Signal List Window” and the SAFETY LOGIC CIRCUIT window together to check the ON/OFF status of the input signal.
8 System Setup
8.26 Safety Logic Circuit

• When #1 FSBIN 1 signal and #1 FSBIN 2 signal are turned ON at the same time, #1FSBOUT1 signal is ON for one second.

```
#1 FSBIN1

#1 FSBIN2

#1 FSBOUT1 1sec
```

• When #1 FSBIN 1 signal and #1 FSBIN 2 signal are not turned ON at the same time, #1FSBOUT1 signal remains OFF.

```
#1 FSBIN1

#1 FSBIN2

#1 FSBOUT1
```
8 System Setup
8.26 Safety Logic Circuit

The input of the full speed test (S-FST) signal is set in the following example. After turning ON the GP safety input signal (FSBIN1) under the teach mode, the safety logic circuit, in which the full speed test output is turned ON, is set.

1. The following safety logic circuit is created.
   01 TEACH AND FSBIN1 S-FST

2. When FSBIN1 signal is turned ON, S-FST signal is turned ON.

3. When S-FST signal is turned ON, “Full-speed test mode (Safety logic circuit)” is shown on the message area of the programming pendant. Also, the control status signal #80047 is turned ON.

NOTE

S-FST signal is enabled only in the teach mode.
The safety logic circuit: example 8

The method to use MS-OUT signal is explained in the following.

1. The following safety logic circuit is created.
   
   01 #1 FSBIN1 MS-OUT01

2. When FSBIN1 signal is turned ON, MS-OUT01 signal is turned ON.

3. The MS-OUT01 signal created by the safety logic circuit can be used as the input signal of AXIS RANGE LIMIT of the functional safety (optional), etc.

8.27 Robot Stop Factor Monitor Function

8.27.1 Outline

The robot stop factor monitor function is a function to detect a robot stop, which is caused by the servo OFF or the hold and so on. The factors, which caused to stop the robot, are stored in chronological order and displayed on the screen.

8.27.1.1 The Robot Stop Factor

This function detects the servo OFF status caused by the safety circuit board instructions or the main CPU instructions and the hold status caused by programming pendant operations or signals. The detection items are described as follows.

Table 8-1: The List of the Servo OFF Factors by Main CPU Instructions

8.27 Robot Stop Factor Monitor Function

8.27.1 The Robot Stop Factor Record Number

- One screen: maximum 37 factors
- History number: 20 histories

If exceeds the number above, the old data will be deleted, and the new data will be recorded.

8.27.2 Operation

8.27.2.1 Displaying the Robot Stop Factor Monitor

The RB STOP FACTOP MONITOR can be referred by following procedures.

1. Select {ROB STOP FACTOR MMONITOR} under the {IN/OUT} in the main menu.

   ![Robot Stop Factor Monitor Window](image)

   - The RB STOP FACTOR MONITOR window appears.
The following items are displayed on the RB STOP FACTOR MONITOR window.

- DETECT TIME: Shows the time when the robot stop factor was detected.

- The factor detected by the main CPU is displayed on the first line.

- The factor(s) detected by the safety circuit board is (are) displayed from the second line on the screen.

- The data on the first page is the latest one, and the page 20 is the oldest data.
8.27.2.2 Clear the Robot Stop Factor Information

1. Select {DATA} from the pull-down menu on the RB STOP FACTOR MONITOR window when the security mode is the management or higher mode. {CLEAR} is displayed.

2. Select {CLEAR}, and the confirmation dialog “Initialize?” appears. Press {YES}., and the all information of the robot stop factor is cleared.

The robot stop factor information is not saved when turning the power supply OFF. Therefore, it will be initialized when turning the power supply ON again. If it is necessary to save the data, please store the data into the external memory devices before turning the power supply OFF.
8.28 Robot Detachment Function

8.28.1 Setting Maintenance Mode

This mode is used for setting up and maintenance of the robot system.

1. Turn the power ON while pressing [MAIN MENU] on the programming pendant.
   – Maintenance mode screen starts up.

2. Select (SYSTEM) under the main menu.
   – Sub menu is shown.
3. Select {SECURITY}.
   – Mode selection screen is shown.

4. Press [SELECT] to select the mode.
   – Mode selection list is shown.

5. Move the cursor to {SAFETY MODE} and select.
   – Password input box is shown.
8 System Setup
8.28 Robot Detachment Function

6. Input the password for safety mode and press [ENTER].

   – When the correct password is input, security mode is changed.

8.28.2 Setting Robot Detachment Function

Operator can set or modify the setting items for robot detachment function in detail setting screen.

The specified parameters are to be set automatically according to the setting contents in detail setting screen.

1. Select (SYSTEM) under the main menu.

   – Sub menu is shown.
2. Select {SETUP}.
   - “SETUP” screen is shown.

3. Move the cursor to {OPTION FUNCTION} and select.
   - “OPTION FUNCTION” screen is shown.

4. Move the cursor to {ROBOT DETACHMENT} and select.
   - Detail setting screen for robot detachment function is shown.
8 System Setup
8.28 Robot Detachment Function

5. Change the setting contents.
   – Move the cursor to the target group and select to change the setting.
   – Select “ATTACHED” or “DETACHED”.

![Robot Detachment Function Diagram]

6. Change the setting item on JOB.
   – Move the cursor to the JOB setting item and select.
   Every pressing the [SELECT] switches the indication between “○” and “-”.

![JOB Setting Diagram]

   – Description for the setting items on JOB

   When “-” is selected: The JOB including detached group cannot be started up.

   When “○” is selected: The JOB including detached group can be started up. However, the detached axes cannot be operated.
7. Press [ENTER].
   – Confirmation message for parameter change is shown.

8. Select {YES}. to confirm the change.
   – System parameters are to be set automatically, then the screen returns to the option function screen.
8.29 Axes Detachment Function

8.29.1 Outline

The axes detachment function is to invalid the connection of specific axes by setting in maintenance mode. When the axes detachment function is set, the system can be started without any alarm even if some axes are not connected physically during setup or motor exchange.

8.29.2 Setting Maintenance Mode

Start the maintenance mode and set the security mode to the safety mode. (Refer to chapter 8.28.1 “Setting Maintenance Mode”.)

8.29.3 Setting Axes Detachment Function

Operator can set or modify the setting items for axes detachment function in detail setting screen.

The specified parameters are to be set automatically according to the setting contents in detail setting screen.

1. Select {SYSTEM} under the main menu.
   – Sub menu is shown.

2. Select {SETUP}.
   – Setting selection screen is shown.
3. Move the cursor to {OPTION FUNCTION} and select.
   – “OPTION FUNCTION” screen is shown.

4. Move the cursor to {AXES DETACHMENT} and select.
   – Detail setting screen for axes detachment function is shown.

5. By pressing [PAGE], the target group for setting is switched.
6. Change the setting contents.
   - Move the cursor to the target axis and select to change the setting.
   - Select “ATTACHED” or “DETACHED”.

7. Press [ENTER].
   - Confirmation message for parameter change is shown.

8. Select (YES) to confirm the change.
   - System parameters are to be set automatically, then the screen returns to the option function screen.

8.29.4 Specific Output and Messages

When the system is started in online mode and any axes (at least one axis) are detached, the following specific output and message are output all the time.

- Specific output #50913 "AXES DETACHMENT"
- Message is displayed

The following message is output in the bottom right message area on the window of the programming pendant.

"Axes detachment has been set [sub code]"

The control group including the detached axis is shown in [sub code].
8.29.5 Restrictions

- **Operation with restrictions**
  When the axes detachment function is set, the following operations are restricted. If these operations are tried to be performed, an error or an alarm occurs.
  - Playback
  - Test run
  - Job registration (insert/modify/delete jobs in the target control group)
  - Variable registration
  - Second home position registration
  - Home position registration
  - Work home position registration

**SUPPLEMENT**

Use the robot detachment function (chapter 8.28 “Robot Detachment Function”) when performing the playback operation in the state that the specific manipulator, the base, or the station is detached.

Followings are the errors/alarms which may occur by the axes detachment.

<table>
<thead>

</tbody>
</table>
8 System Setup
8.29 Axes Detachment Function

CAUTION

- While the axes detachment function is set, the manipulator may not be able to move to the taught position or operate in the right posture, because some axes do not move. When performing one of the following operations while the axes detachment function is set, pay careful attention to the movement of the manipulator and prevent interference between the manipulator and peripheral devices.

- Operation without restrictions
  The axes detachment function doesn't restrict the following operations, though be careful when performing.
  - Jog operation (link, Cartesian, user, tool, cylindrical, and I/O jog)
  - Next/Back operation
  - Variable movement
  - Second home position movement
  - Work home position return

- Restriction in using with other function
  Before using the following function, be sure to release the axes detachment function.
  - Functional safety function
    If there is any detached axis, safety monitoring cannot be performed.
8.30 User Group Input and Output

8.30.1 Outline of the Function

The input and output of user group can be defined by one group of two or more GP I/O signals. The value of the group signal can be expressed in the numerical value.

8.30.2 User Group Input

8.30.2.1 User Group Input Setting

Set the security to the management mode.
1. Select (I/O) in the main menu.
2. Select {USER GROUP INPUT}.
   – The USER GROUP INPUT window is shown.
3. Select {SETTING} of {DISPLAY} in the pull down menu.
   – The USER GROUP INPUT SETTING window is shown.

START
Specify the first number of the GP input signal to be allocated.

LENGTH
Specify the number of the signals which is allocated to one group (1 to 32). When the parity check is specified, the parity bit is the highest bit. When the length is 1, the parity check cannot be specified.

PARITY
Specify the parity check.
NONE : Parity check is not specified.
ODD  : Odd parity is specified
EVEN  : Even parity is specified.

NAME
The group signal name is set.
4. The user group input is set.

```

8 System Setup
8.30 User Group Input and Output

8.30.2.2 Display of User Group Input

1. Select {I/O} in the main menu.
2. Select {USER GROUP INPUT}.
   – The USER GROUP INPUT window is shown.

① **SIM**
   Normally, the input status of the user group cannot be changed by manual operation. However, the status can be set to be changeable for the operation check and etc. The status is changed every time an item is selected.
   - SIM : Manual operation is possible
   - (Blank) : Normal status

**NOTE**
All the GP input signals which belong to the group in the status of “SIM” are in the status of “SIM”.
For details of this status, refer to “YRC1000micro OPTIONS INSTRUCTIONS FOR Concurrent I/O (RE-CKI-A469) 13.2.3 Changing Signal Status from GP Input Status Window”.

② **VALUE**
The input status of the user group.
When the group in the “SIM” status is selected, the value can be changed.

③ **PARITY**
The status of the parity bit
   - : No parity check
   - : 0
   - : 1
   ERR : Parity error

④ **NAME**
The group signal name
8.30.3 User Group Output

8.30.3.1 User Group Output Setting

Set the security to the management mode.
1. Select {I/O} in the main menu.
2. Select {USER GROUP OUTPUT}.
   – The USER GROUP OUTPUT window is shown.
3. Select {SETTING} of {DISPLAY} in the pull down menu.
   – The USER GROUP OUTPUT SETTING window is shown.
   – The USER GROUP INPUT SETTING window is shown.

1 START
   Specify the first number of the GP output signal to be allocated.

2 LENGTH
   Specify the number of the signals which is allocated to one group (1 to 32). When the parity check is specified, the parity bit is the highest bit. When the length is 1, the parity check cannot be specified.

3 PARITY
   Specify the parity check.
   NONE : Parity check is not specified.
   ODD : Odd parity is specified
   EVEN : Even parity is specified.

4 NAME
   The group signal name is set.
4. The user group output is set
8.30.3.2 Display of User Group Output

1. Select {I/O} in the main menu.
2. Select {USER GROUP OUTPUT}.

   – The USER GROUP OUTPUT window is shown.

<table>
<thead>
<tr>
<th>USER GROUP OUTPUT</th>

</tbody>
</table>

① VALUE
The output status of the user group.

② PARITY
The status of the parity bit

□□ : No parity check
● ○ : 0
● ● : 1
ERR : Parity error

③ NAME
The group signal name
8.31 Variable Allocation

The number of the global variable allocation can be changed by performing the following operations. However, after performing this change operation, the data of the JOB, the user coordinate or etc. is initialized and the variable data or the variable name data saved before the change cannot be loaded. Thus, the following operations are allowed only for the administrator who can set the security mode to the management mode or higher.

1. By pressing [MAIN MENU] on the programming pendant, turn ON the power.
2. Change the security mode to the management mode.
3. Select {SYSTEM} in the main menu.
4. Select {SETUP}.
5. Select {OPTION FUNCTION}.
6. Select {DETAIL} of the variable allocation.

   The DETAIL window of the variable allocation is shown.

   ![Variable Allocation Window]

The number can be changed by selecting "++" / "--" or inputting the number directly. The changeable minimum and maximum value are shown in "RANGE". Since the global variable shares the determined section/area, the value shown in "RANGE" is changed along with the setting value.

- When the "++" is selected, the allocation is increased by the increment of 50.
8 System Setup
8.31 Variable Allocation

- When the "--" is selected, the allocation is decreased by the decrement of 50.

7. Press [ENTER].
   - The confirmation dialog of the parameter change shows up.
8. Select {YES}.

- Select {YES} for the confirmation dialog. When a file needs to be initialized due to the change of the variable allocation, the confirmation dialog of initialization shows up. Select {YES} for all the confirmation dialog of initialization.
9. After the initialization of file is completed, the option function window is shown.

When the position variable allocation is changed, not only the data of job variable/variable name but also the following files are cleared. Be sure to handle the data properly.

- User coordinate
- Robot calibration data
- Conveyor calibration data
8.32 Controller Information Display Function

The configured information in this robot system can be checked by the following procedures.

1. Select {SYSTEM INFO} in the main menu.

2. Select {CONTROLLER INFORMATION}.
   - The CONTROLLER INFORMATION window is shown.

3. Select {DISPLAY}.
4. Select (OPTION BOARD INFO).
   - The OPTION BOARD INFO window is shown. Move the cursor to the option board to show the details.

5. Press [SELECT].
   - The setting contents of the option board information is shown.
While the CONTROLLER INFORMATION window is shown, the following display is shown by performing the bilingual operation (SHIFT) + (AREA) on the programming pendant are pressed. Select (SYSTEM INFO) - (CONTROLLER INFORMATION) once again.

![Diagram of programming pendant and controller information window]

Please select a Main Menu.
8.33 Manual Brake Release Function

8.33.1 Outline of Function

The manual brake release function allows forcible release of each motor brakes of the manipulator and external axes by programming pendant operation. However, conditions shown below should be followed.

- **Operating Conditions**
  1. YRC1000micro Status
     The YRC1000micro has to be launched correctly).
  2. Mode: Mode switch on the programming pendant
     The function can be used in all modes: Remote / Play / Teach.
  3. Security Mode
     The function can be used in all modes: Operation / Editing / Management / Safety.
  4. Others
     • Servo power is OFF
     • Emergency stop is OFF
       (programming pendant, external signals)

Fig. 8-6: Alarm Window

1 Basically, the manual brake release function is available even at alarm occurrence.
   However, the manual brake release function cannot be used if the communication failure between each board occurs due to a board failure, etc.

<Example>
The manual brake release cannot be performed at occurrence of the alarm 0010 as shown in fig. 8-6, since the communication with the servo board becomes unavailable.
8 System Setup
8.33 Manual Brake Release Function

Restrictions
Due to the hardware configuration, the brake release can be performed only by the following units:

- Group of the S-, L-, and U-axes (the first, second, and third axes)
- Group of the R-, B-, and T-axes (the fourth, fifth, and sixth axes)
- The E-axis or the first external axis, etc. (the seventh axis)
- The first or the second external axis, etc. (the eighth axis)

CAUTION
- Use great caution when manually releasing the brake because the brakes of up to 3 axes are released.

8.33.2 Manual Brake Release Operation

1. Select [ROBOT] under the main menu, then select [MANUAL BRAKE RELEASE] under the submenu.

   - [MANUAL BRAKE RELEASE] is shown under the submenu of the main menu [ROBOT].
2. Select "YES".
   - To avoid careless operation mistake, a warning message appears when [MANUAL BRAKE RELEASE] menu is selected.
   - Select "YES" to display [MANUAL BRAKE RELEASE] window.
   - Select "NO" to return to the main menu.
3. Move the cursor to the axis whose brake is to be released. Then press [INTERLOCK] + [SELECT] while gripping the enable switch.

– Since the brakes of multiple axes will be released if the S-, L-, or U-axis (the first, second, or third axis) or the R-, B-, or T-axis (the fourth, fifth, or sixth axes) is selected, one of the following confirmation dialog boxes appears.
8 System Setup
8.33 Manual Brake Release Function

- If the E-axis or the first external axis, or the second external axis (the seventh or eighth axis) is selected, the brake is released and the BRAKE STATUS is displayed.

| BRAKE STATUS | O: Brake locked | ●: Brake released |

- The brake is locked under one of the following conditions:
  - When [SELECT] is released.
  - When the emergency stop button on the programming pendant or on the external device is pressed.
  - When Enable switch is released or gripped further.
  - When the window is switched from the Manual Brake Release window to another window.

---

**CAUTION**

- Brake can be released by pressing [INTERLOCK] + [SELECT] while gripping Enable switch.
  - Note that the brake remains released even though only [INTERLOCK] is released at this time.
4. Select {YES} in the selection dialog box.

- Select {NO} or press [CANCEL] to close the confirmation dialog box without releasing the brake.
  After that, press [INTERLOCK] + [SELECT] while gripping the enable switch to display the confirmation dialog box again. Proceed to the step 4.

- When {YES} is selected, the brake is not released immediately. Do not move the cursor, and press [INTERLOCK] + [SELECT] while gripping the enable switch again to release the brakes of the 3 axes including the axis at which the cursor points.

### BRAKE STATUS

- When the axis whose brake is to be released is changed by moving the cursor, proceed to the step 3.

- The brake is locked under one of the following conditions:
  - When [SELECT] is released.
  - When the emergency stop button on the programming pendant or on the external device is pressed.
  - When Enable switch is released or gripped further.
  - When the window is switched from the Manual Brake Release window to another window.
  - When the interlock connector is pulled out.

**CAUTION**

- Brake can be released by pressing [INTERLOCK] + [SELECT] while gripping Enable switch.
  Note that the brake remains released even though [INTERLOCK] is released at this time.
The brake is locked under one of the following conditions:

- When [SELECT] is released.
- When the emergency stop button on the programming pendant or on the external device is pressed.
- When Enable switch is released or gripped further.
- When the window is switched from the Manual Brake Release window to another window.

### 8.33.3 Warning Message Display

If the manual brake release is performed under the following conditions, the warning message appears in the message area bottom right of the window.

In this case, the brake release cannot be performed.

- Servo power is turned ON.
- Emergency stop button on the programming pendant is pressed.
- External emergency stop signal is input.
9 System Backup

9.1 System Backup with YRC1000micro

For the YRC1000micro, the system data or its software can be collectively backed up in advance so that the data can be immediately loaded and restored in case of an unexpected trouble such as data loss.

9.1 System Backup with YRC1000micro

For the YRC1000micro, two types of system data, CMOS.BIN and CMOSBK.BIN, can be collectively backed up:

9.1.1 Function Types of Data

9.1.1.1 CMOS.BIN

For the normal backup, use this data.

Save: Perform in the normal or maintenance mode.

Load: Perform in the maintenance mode. (the management mode or higher mode)

The loading/saving procedures in the maintenance mode, refer to chapter 9.2 "Backup by CMOS.BIN".

As for saving in the normal mode, refer to "YRC1000micro OPERATOR'S MANUAL (RE-CSO-A058) 7.3.0.2 Saving Data".

Target Area: All areas of the internally stored data. (Note that the monitoring time is not loaded.)

The YRC1000micro enables the backing up of CMOS.BIN files and CMOS.BIN + system software without the programming pendant, as the programming pendant is optional. When performing this operation, change the rotary switch on the front panel of the YRC1000micro as follows, and then connect the USB memory.

The YRC1000micro cannot format a USB memory by using the controller.
9.1 System Backup with YRC1000micro

9.1.1 CMOSBK.BIN

For the normal backup, use this data.

Save: Perform in the normal or maintenance mode.

Load: Perform in the maintenance mode.

(the management mode or higher mode)

The loading/saving procedures in the maintenance mode, refer to chapter 9.6 “Automatic Backup Function”.

Target Area: All areas of the internally stored data. (Note that the monitoring time is not loaded.)

9.1.2 Device

For the backup of the YRC1000micro system, the SD card or the USB memory is used. (The USB connector of the programming pendant is not available in the automatic backup function.)

The following tables show the recommended SD card and USB memory.

</tr>
</tbody>
</table>

In order to save the batch data, the following free space per file is needed in the media.

Approx. 30M Byte

Note that the free space to store the two files is needed when using the automatic backup function.

Also, it is recommended to store the backup data in two or more media cards to minimize problems if the media is damaged.

The water-proof function of the Pendant is not effective while the USB memory is connected.

**NOTE**

If USB memory is connected constantly, there is a risk it drops off.

Use SD card if there is no measures to maintain water-proof function or to prevent USB memory from dropping off.

The USB memory can be connected to the USB connected on the CPU board(JANCD-ACP31-1E).

Forcible insertion may result in the damage of the USB memory and the USB connector.

**NOTICE**

- In case the USB memory is not recognized or an error message appears, pull out it and try inserting it again.
9 System Backup
9.2 Backup by CMOS.BIN

9.2 Backup by CMOS.BIN

Perform the backup by CMOS.BIN in the normal or maintenance mode.

The chart below shows the availability of CMOS save/CMOS load in each security mode in the maintenance mode.

9.2.1 CMOS.BIN Save

Follow the procedures below to save CMOS.BIN in the maintenance mode.

1. Turn ON the YRC1000 micro power supply while pressing [MAIN MENU].

2. Insert a SD card into the SD card slot on the programming pendant.
   - when USB memory is used instead of SD card, mount USB memory and select “USB: PENDANT” or “USB1: CONTROLLER” in the {DEVICE}.

3. Select {EX. MEMORY} under the main menu.
   - The sub menu appears.
4. Select {SAVE}.
   – The save display appears.

   ![Save Display]

   – The items marked with "■" cannot be selected.

5. Select (CMOS).
   – The confirmation dialog box appears.

   ![Confirmation Dialog Box]
6. Select {YES}.
   – Select {YES} to save the CMOS data into the SD card.
   – When saving the file, if the CMOS.BIN file exists in the SD card, the following confirmation dialog box appears.

7. Select {YES}.
   – The CMOS.BIN file is overwritten in the SD card.

NOTE
When not using the data stored in the portable memory device, make sure to keep the device under an appropriate management.
9.2.2 CMOS.BIN Load

Follow the procedures below to load CMOS.BIN.

1. Turn ON the YRC1000 micro power supply while pressing [MAIN MENU].

2. Change the security mode to the maintenance mode or higher mode.

3. Insert a SD card into the SD card on the programming pendant.
   - When USB memory is used instead of SD card, mount USB memory and select “USB: Pendant” or “USB1: Controller” in the {DEVICE}.

4. Select {EX. MEMORY} under the main menu.
   - The sub menu appears.

5. Select {LOAD}.
   - The load display appears.

   - The items marked with "■" cannot be selected.
9.2 Backup by CMOS.BIN

6. Select (CMOS).
   - The confirmation dialog box appears.

   ![Confirmation Dialog Box]

7. Select (YES).
   - The loaded CMOS.BIN file contents are reflected in the data inside the robot.

   ![NOTICE]

   When the “CMOS load” is performed, the current CMOS data is replaced with the CMOS data (the contents of “CMOS.BIN”) in the selected device. Therefore, before performing the load, make sure to perform the “CMOS Save” of the CMOS data to be loaded.

   - When the message “Loading system data. Don’t turn the power off.” on the human interface display area disappears, the loading process is complete.
   When the loading process for the CMOS.BIN file is complete, the message “Select ‘Safety Board FLASH Reset’” on the human interface display area appears. Perform “Safety Board FLASH Reset” by referring to the following procedure.

8. Change the security to the safety mode.
9. System Backup
9.2 Backup by CMOS.BIN

9. Select {FILE} - {INITIALIZE} under the main menu.
   – The INITIALIZE window appears.

10. Select {YES}.
   – When the message "Select 'Safety Board FLASH Reset" on the human interface display area disappears, the safety board FLASH data reset is complete.
9.3 Saving a CMOS.BIN File When the Programming Pendant is not Used

1. Change the rotary switch (RSW) on the front panel of the YRC1000micro “0” to “A”. When changing the rotary switch, use a precision screwdriver (flathead, 2 mm). Then connect the USB memory to the YRC1000micro.

2. Turn on the YRC1000micro power supply.
   - The saving process of a CMOS.BIN file to the root directory of the USB memory starts.
   - While saving the data, the 7SegLed rotates every second and displays as shown below.
   - When the process is complete, the 7SegLed repeats the full-ON state and the full-OFF state every second.

   ![Image of 7SegLed](image)

   - The CMOS.BIN file is written in the root directory of the USB memory. In case CMOS.BIN file is already in the root directory of the USB memory, the file is forcibly overwritten.
   - While saving the data to the USB memory, do not disconnect the USB memory. It may result in the corruption of the file contents or damage to the USB memory.
   - Two or more USB memories cannot be used simultaneously for one USB connector.

3. When the saving process of the CMOS.BIN file is complete, turn OFF the YRC1000micro power supply. However, if there is an access lamp on the USB memory, make sure to confirm that the access lamp is off before turning OFF the YRC1000micro power supply.
   - Return the rotary switch (RSW) on the front panel of the YRC1000micro from "A" to "0".
   - Disconnect the USB memory.
9.4 Saving a CMOS.BIN + System Software When the Programming Pendant is not Used

1. Change the rotary switch (RSW) on the front panel of the YRC1000micro from "0" to "B". When changing the rotary switch, use a precision screwdriver (flathead, 2 mm). Then connect the USB memory to the YRC1000micro.

2. Turn on the YRC1000micro power supply.
   - The saving process of a CMOS.BIN + System software file to the USB memory starts.
   - While saving the data, the 7SegLed rotates every second and displays as shown below.

   ![7SegLed Rotation Diagram]

   - When the process is complete, the 7SegLed repeats the full-on state and the full-off state every second.

   - The CMOS.BIN file is written in the root directory of the USB memory. When there is a CMOS.BIN file in the root directory of the USB memory, the file is forcibly overwritten.

   - When saving the data to the USB memory, do not disconnect the USB memory. It may result in the corruption of the file contents or damage to the USB memory.

   - Two or more USB memories cannot be used simultaneously for one USB connector.
3. When the process is complete, turn OFF the YRC1000micro power supply. However, if there is an access lamp on the USB memory, make sure to confirm that the access lamp is off before turning OFF the YRC1000micro power supply.

- Return the rotary switch (RSW) on the front panel of the YRC1000micro "B" to "0".
- Disconnect the USB memory.
## 9.5 7SegLED Error Display

When the following error number appears on the 7SegLED, confirm the details of the error, and resolve the problem. The error number appears repeatedly.

E9xxx | Error code for YASKAWA. Turn the YRC1000micro power OFF and ON again. If this error occurs again, replace the SD card in the JANCD-ACP31-1E board.

x: Indicates the number from 0 to 9.
9.6 Automatic Backup Function

9.6.1 Automatic Backup Function

9.6.1.1 Objective

With the automatic backup function, the data saved in the YRC1000micro such as system setting or operational condition are collectively backed up in the SD card, which is stored in the programming pendant, or the selected device at the automatic backup window.

Able to back up to the following devices.

- The SD card of the programming pendant
- The SD card of the ACP31 board
- The RAM AREA of the ACP31 board (It will display, when the high speed Ethernet server function is effective.)

**NOTE**
The automatic backup function is enabled only while the YRC1000micro power supply is ON whereas it isn't while in the maintenance mode or the power supply is OFF.

9.6.1.2 Outline

The automatic backup function saves the internally stored data in a single file in advance for the smooth restoration from unexpected troubles of the YRC1000micro.

The teaching operation is one of the factors that changes the internally stored data. Thus, a mode which backs up the latest data after the teaching operation is prepared. To confirm the termination of the teaching operation, check the mode key whether it is changed from teach mode to play mode.

Other than the teaching operation, the present position of the robot or the value of a variable can be pointed out as the factors to change the internally stored data. These data, however, are changed after each operation and have very little need to be retained permanently. Accordingly, backing up these data at regular interval should be well enough to operate and the mode to back up the data at regular interval is also prepared.

Furthermore, the mode to back up the data when starting up the YRC1000micro and when inputting signals are also available for some specific versions.

With the automatic backup function, all the part where the internal data is stored in the physical memory area is collectively saved. If there is any data which is in the middle of changing while executing the automatic backup function, the data might not be usable for restoration because of its inconsistency. Therefore, the function is terminated with an error during the play back operation or while the manipulator is in motion so that the automatic backup cannot be operated. Set the automatic backup function to be executed while the manipulator is not in the playback status and while the manipulator is stopped.
The automatic backup function has the following functions and features.

<table>
<thead>
<tr>
<th>No</th>
<th>Function/Feature</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Cyclic backup</td>
<td>In the teach mode, the data in memory is backed up in a specified cycle from a specified starting time. This function backs up as much of the latest data as possible during editing. The backup data saved in the SD card can be loaded to the YRC1000micro in case of data loss so that the damage can be minimized.</td>
</tr>
<tr>
<td>2</td>
<td>Backup when switching modes</td>
<td>When switching the mode from the teach mode to the play mode, the data in memory is backed up. The editing data is backed up when editing is completed. The latest data is automatically backed up with this mode.</td>
</tr>
<tr>
<td>3</td>
<td>Backup when start-up</td>
<td>When the YRC1000micro starts up, the data in memory is backed up. When the YRC1000micro is start-up, the data in memory is backed up. Since the editing/playback operation is usually completed when the YRC1000micro power is turned OFF, the latest data is automatically backed up with this mode.</td>
</tr>
<tr>
<td>4</td>
<td>Backup when inputting specified signals</td>
<td>The data in memory is backed up when a specified signal (#40560) is input. The data in memory is backed up by the signal from the host at the intended timing. Although the above mentioned items 1 to 3 are designed to back up the data automatically, this function backs up the data in accordance with the instruction from the host.</td>
</tr>
<tr>
<td>5</td>
<td>Backup while robot program is stopped</td>
<td>The backup during playback is disabled. However, in the play mode, the backup is enabled if the robot is stopped. (“Cyclic backup” and “Backup when inputting specified signals”) Backs up the variables for essential data.</td>
</tr>
<tr>
<td>6</td>
<td>Backup and retry at low priority</td>
<td>The data in memory is backed up at low priority so that this operation does not affect the other operations. When other operations affect the backup operation, the backup is suspended and retried later. The backup operation hardly affects the other operations so that the programming pendant can be used even during the backup operation.</td>
</tr>
<tr>
<td>7</td>
<td>Backup in binary</td>
<td>The data is saved as binary data. Backup in binary allows the system to be easily and speedily restored.</td>
</tr>
<tr>
<td>8</td>
<td>Setting of items</td>
<td>Parameters can limit the settings of the backup condition. Unnecessary settings can be avoided with this setting.</td>
</tr>
</tbody>
</table>
9.6.2 Settings for Automatic Backup

To set the automatic backup function, set each item at the automatic backup display.

<table>
<thead>
<tr>
<th>NOTE</th>
</tr>
</thead>
</table>

Four ways to perform the automatic backup are available: "Cyclic", "Backup when switching modes", "Backup when start-up'", and "Backup inputting specified signals".

The automatic backup can be performed only when the robot is not during playback, and the robot is stopped.

Automatic backup function can be set from the command of the optional high speed Ethernet server function.

9.6.2.1 The SD Card of the Programming Pendant

To use the automatic backup function, insert the SD card into the SD card slot on the programming pendant. Only while the YRC1000micro power supply is OFF, the SD card can be inserted or removed.

When the data could not be saved in the SD card during an automatic backup due to the absence or insufficient capacity of the SD card, an error message “Confirm the status of SD card” appears. At the same time, the signal “occurrence of error” can be output to an external device, but the robot program will not be stopped. Check if the SD card is inserted and if it has enough capacity, and take the necessary actions. If no actions are taken while the error occurs, the data cannot be saved.

YASKAWA recommends that the data be saved in the two or more SD cards to minimize problems if the SD card should be damaged.

Regarding the SD card for auto backup, refer to "Recommended SD card" in chapter 9.1.2 “Device”.

Storage capacities needed for SD card are as follows:

| (The number of stored files + 1) X approx. 30MByte |

The number of storable files is automatically calculated and the MAX value is shown when AUTO BACKUP SET display appears.
9.6.2.2 The SD Card of the ACP31 Board

Set the following procedures in advance to back up to the SD card of the ACP31 board. If the following procedures are not done, “SD: Controller” would not be shown on the device list of the auto backup set display.

1. Turn ON the Power supply while pressing the [MAIN MENU] on the programming pendant.
2. After starting maintenance mode, change the security mode to the management or higher mode.
3. Select (SYSTEM) in the main menu.
   – When the sub menu will appear, select {SETTING}-{OPTION FUNCTION}. The list of the optional function will appear.
4. Select {Automatic backup (ACP31)}, and change the “UNUSE” to “USE”.
   – Select {YES}, when the confirmation dialog appears.
   – Select {YES}, when the confirmation dialog appears, and ask “initialized related files?” or “CMOSBK. BIN?”
   – It will allocate automatic backup to the SD card of the ACP31.
   During allocating, the massage of do not turn the power off appears.
   – The message of the maintenance mode will appear, when finished allocating.
5. Turn ON the power supply again.
6. The online window appears on the programming pendant.
7. Change the security mode to the management mode.
8. Select {CONTROLLER SET}-{SET AUTO BACKUP}.
9. It would be error without inserting the SD card in the programming pendant, when the device is set on the SD card in the programming pendant. Push down the [cancel], when the error occurs.
10. Select the device, and change to “SD: Controller”.

Backup setting to the SD card of the ACP31 board should be done while the robot is not operating.

When access to SD card of the ACP31 by using other than the auto backup function, the auto backup function and the exclusive process would be run. Therefore, the save time of the auto backup will extend.

(Normally, it takes about three minutes to finish backing up. However, duplication access to the SD card of the ACP31 board takes three to ten minutes.)

9.6.2.3 RAMDISK on the ACP31 Board

RAMDISK will be shown when the high speed Ethernet server function is effective. Refer to “YRC1000micro OPTIONS INSTRUCTIONS FOR ETHERNET FUNCTION (HW1484452)” for more details.

<td>Backup</td>
</tr>
</tbody>
</table>

* Retry is not performed when an error occurs.

* An error can be indicated by a message depending on setting.
- **Reserve Time Backup**
  While the data in the YRC1000micro memory is being edited or overwritten, the automatic backup is not performed at the specified backup starting time and is suspended and retried later. To start the backup at the reserved time, set to the time when the robot program is stopped and no job or file is edited.

- **Backup when Switching from Teach Mode to Play Mode**
  When the mode is repeatedly switched from the teach mode to the play mode or vice versa within 1 to 2 seconds, backup starts after the last time the mode is switched.
  Execute the job after three second since starting the back-up.

- **Backup when the YRC1000micro starts up**
  Since the automatic backup process is added to the YRC1000micro start-up process, a few extra seconds are needed to start up the YRC1000micro.

- **Backup when Specific Signal is Input**
  While the YRC1000micro memory is edited such as overwriting, the backup operation becomes an error even if there is an input to a specific signal (#40560). To start the specific input backup, perform it while the robot program is stopped and a job or file is not being modified.
  Also, since the signal input is executed at rising detection, turn the signal to “0” if it is already “1”, return to “1” again.
  Execute the job after three second since starting the back-up.

- **Overwriting Limit in SD card**
  The number of times that the SD card can be overwritten is limited. Because frequent backup operations may shorten the life of SD card, the number of backup times should be minimized as much as possible.
9.6.2.5 Setting Examples

- **Setting Example 1**
  The following diagram shows a setting example with the following conditions:
  
  **BASE TIME**: 12:30
  
  **BACKUP CYCLE**: 60 (minutes)
  
  **RETRY CYCLE**: 10 (minutes)

- **Setting Example 2**
  The following diagram shows a setting example with the following conditions:
  
  **BASE TIME**: 20:00
  
  **BACKUP CYCLE**: 1440 (minutes) (24 hours)
  
  **RETRY CYCLE**: 60 (minutes)

**NOTE**

While a job is being executed, the automatic backup or retry is not performed. Also, after an error occurs in writing into the SD card, the retry is not performed until the next backup starting time.
### Settings

Automatic backup setting is performed by setting the following items on the AUTO BACKUP SET window:

- **RESERVE TIME BACKUP**
  (Setting for performing the backup on what day of the week, every day, or in a specific cycle)

- **BASE TIME**

- **BACKUP CYCLE**

- **RETRY CYCLE**

- **MODE CHANGE BACKUP**
  (VALID/INVALID of the backup when switching the mode from the teach mode to the play mode)

- **STARTUP AUTO BACKUP**
  (VALID/INVALID of the backup when the YRC1000micro is started up)

- **SPECIFIC INPUT BACKUP**
  (VALID/INVALID of the backup when inputting specified signals)

- **UNIV.OUT NO. ON ERROR**

- **DISPLAY AT EMERGENCY**

- **DURING ALARM OCCURENCE**

- **DEVICE**
  (Setting of the device to store the automatic backup file)

- **STORED FILE SETTING**
  (It is possible to set when “SD: Pendant” is set in DEVICE.)

---

**NOTE**

When the “SD: Pendant” or “SD: Controller” is selected on the auto backup display, the capacity of the SD card in the specified device will be checked. Therefore, a few seconds may be needed to open the setting window. For the “SD: Pendant”, an error may occur without setting in the SD card.

When changing the settings of “STORED FILE SETTING” or executing “ARRANGE”, the files “CMOSBK.BIN” and “CMOSBK???.BIN” (?? denotes figures) in the SD card are changed in name or deleted. If a certain file of this type is needed to be saved before changed in name or deleted, evacuate it into a PC, etc. beforehand.

While an error occurring, the setting of the each item on the auto backup set display cannot be changed.
9. System Backup
9.6 Automatic Backup Function

1. Turn ON the YRC1000micro.
   – Insert the SD card to the programming pendant, when the backup is set on the SD card of the programming pendant.

2. Change the security mode to the management mode.

3. Select {SETUP} under the main menu.

4. Select {AUTO BACKUP SET}.
   – The AUTO BACKUP SET display appears.

A. RESERVE TIME BACKUP
Pressing [SELECT] displays the following list. Select the item from “SET CYCLE”, “EVERY DAY”, or the day of the week (“MONDAY” to “SUNDAY”).

Please note that after setting the base time, the backup cycle, and the retry cycle, select the item from “SET CYCLE”, “EVERY DAY”, or the day of the week (“MONDAY” to “SUNDAY”).

If “SET CYCLE”, “EVERY DAY”, or the day of the week (“MONDAY” to “SUNDAY”) is set before setting one of the base time, the backup cycle, and the retry cycle, “INVALID” is selected for RESERVE TIME BACKUP.
9.6 Automatic Backup Function

“INVALID”: RESERVE TIME BACKUP is not performed.
“SET CYCLE”: The automatic backup is performed every BACKUP CYCLE based on the specified BASE TIME.
“EVERY DAY”: The automatic backup is performed at the specified BASE TIME every day.
“MONDAY” to “SUNDAY”: The automatic backup is performed at the specified BASE TIME every week.

– Setting example for the automatic backup at 11:29 every day

– Setting example for the automatic backup at 11:29 on every Thursday

B. BASE TIME
Specify the reference time to start the automatic backup. The reference time ranges from 0:00 to 23:59.

C. BACKUP CYCLE
Specify the backup cycle to perform the cyclic back up. Set the backup cycle in units of minutes. The cycle setting ranges from 10 to 9999 minutes. After the first backup, the following backups are performed automatically in every BACKUP CYCLE. When “EVERY DAY” or the day of the week (“MONDAY” to “SUNDAY”) for RESERVE TIME BACKUP is selected, BACKUP CYCLE cannot be input.
D. RETRY CYCLE

Every time the automatic backup is implemented, the memory data in the controller is obtained, and the data is compared with the original memory data. If they are not the same, the retry of the automatic backup is implemented. However, please note that when the device is not inserted and the automatic backup is failed, for example, the retry is not executed.

Set the retry cycle in units of minutes. The cycle setting ranges from 0 to 255, and should be shorter than the BACKUP CYCLE. If the value is the same as or longer than the BACKUP CYCLE, RESERVE TIME BACKUP cannot set to “VALID”.

When it is set to 0, retry will not be performed.

E. MODE CHANGE BACKUP

Set the automatic backup function to be valid or invalid when the mode is switched from teach mode to play mode.

Each time [SELECT] is pressed, “INVALID” and “VALID” are displayed alternately.

F. STARTUP AUTO BACKUP

Set the backup function to be valid or invalid when the power of the YRC1000micro is turned ON.

Each time [SELECT] is pressed, “INVALID” and “VALID” are displayed alternately.

G. SPECIFIC INPUT BACKUP

Set the backup function to be valid or invalid when specific input signal (# 40560) is input (rising edge from 0 to 1).

Each time [SELECT] is pressed, “INVALID” and “VALID” are displayed alternately.

H. UNIV.OUT NO. ON ERROR

Set “1” to the specified user output signal which was specified in this chapter when the automatic backup error occurs.

The term “automatic backup error” here means that the backup is not performed successfully before the next backup (including retry operation) starts.

I. DISPLAY AT EMERGENCY

Set the method of notification of the automatic backup error to “ERROR” or “MESSAGE”.

Each time [SELECT] is pressed, “ERROR” and “MESSAGE” are displayed alternately.

J. DURING ALARM OCCURENCE

Set the backup function to be valid or invalid when an alarm occurs.

Each time [SELECT] is pressed, “INVALID” and “VALID” are displayed alternately.
9 System Backup
9.6 Automatic Backup Function

K. DEVICE
Press (SELECT) to display the device list.

<table>
<thead>
<tr>
<th>The Device Name in Display</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>SD: Pendant</td>
<td>Set the backup to the SD card of the programming pendant.</td>
</tr>
<tr>
<td>SD: Controller</td>
<td>Set the backup to the SD card of the ACP31 board. When the “SD: Controller” of the device name is not shown, refer to chapter 9.6.2.2 “The SD Card of the ACP31 Board”.</td>
</tr>
<tr>
<td>RAMDISK</td>
<td>It will be shown when the optional function of High Speed Ethernet Server function is effective. It can back up by the YRC1000micro high speed Ethernet server function command. Refer to “YRC1000micro OPTIONS INSTRUCTIONS FOR ETHERNET FUNCTION (HW14834452)”.</td>
</tr>
<tr>
<td>USB1: Controller</td>
<td>Set the backup to the USB memory of the ACP31 board.</td>
</tr>
</tbody>
</table>

L. STORED FILE SETTING
Set the number of files to be stored by the automatic backup function. The number mentioned on the right side of this item with “(Max)” indication is the maximum number of files that can be stored in the SD card inserted when this window is displayed.

The settings range from 1 to (Max). When this setting value is changed, the backup file arrangement starts. (Max is 100.)

M. BACKUP FILES
Indicates the existence of the files or the number of backup files stored in the SD card inserted when this window is displayed.

N. LATEST BACKUP FILE
Indicates the date of the latest file in the SD card inserted when this window is displayed.

O. ARRANGE
When the setting of maximum number of stored files is changed, the file arrangement of the backup files in the SD card is executed.

With this operation, the file arrangement can be performed without changing the maximum number of stored files.

ARRANGE will not be displayed when the device of the SD: controller is set on.

5. Set the desired item, and press [ENTER].
9 System Backup
9.6 Automatic Backup Function

- **Window Settings**
  RS parameter can restrict the settings of some items in the automatic backup window.
  When setting the bit of RS096 parameter shown below to “1”, the corresponding items are restricted. The restricted items are indicated with “INVALID” in the display and inputting/modification to the item becomes impossible. Also, the automatic backup does not function with the restricted items.

- **Output the Backup Processing Status**
  Able to confirm the backup processing status by the system output signal.
  <#50766> It is creating the auto backup data.
  When this signal is turned ON, it is creating the backup data. Some operations are limited. For example, the start signal is not accepted.
  <#50767> It is transferring the backup data.
  When this signal is turned ON, writes the data to the SD card after creating the backup data. Do not remove the SD card from the programming pendant during this period.
9.6.3 Limiting the Automatic Backup File Creation

9.6.3.1 Setting to Limit the Automatic Backup File Creation

It is applicable to limit the backup file creation executed by the automatic backup function to once a day.

To limit the backup file creation to once a day, set the following parameter.

<table>
<thead>
<tr>
<th>Parameter number</th>
<th>Contents</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>S2C682</td>
<td>Limits the backup file creation executed by the automatic backup function to once a day.</td>
<td>0 (Invalid) 1 (Valid)</td>
</tr>
</tbody>
</table>

NOTE

When the automatic backup function is requested to start in the state of limiting the automatic backup file to once a day, an error occurs to notify that the backup has not been processed.

To avoid the above error, set DISPLAY AT EMERGENCY to "message".

For the setting of DISPLAY AT EMERGENCY, refer to chapter 9.6.2.6 “AUTO BACKUP FUNCTION SET Window”.
9.7 Loading the Backup Data from the SD Card

To restore the backup memory in the auto backup function is done in the maintenance mode. Otherwise, restore from the SD card of the programming pendant or USB memory when backup is done at the optional high speed Ethernet function command. Prepare either of the SD card or the USB memory to make copies.

9.7.1 Loading Procedure

To restore from the SD card of the programming pendant, perform the following procedures No.1 to 8. To restore from the SD card on the ACP31 board, perform the following procedures from No.9.

For the USB memory, select “USB: Pendant” or “USB1: Controller” in the {EX. MEMORY} - {DEVICE} to restore.

1. Insert the SD card with the backup data in the SD card slot on the programming pendant.
   (When selecting “USB1: controller”, insert it in the ACP31 board.)
   – The backup data is stored under the file name “CMOSBK.BIN” or “CMOSBK???.BIN” (?? denotes figures.)

2. Turn ON the YRC1000 micro power supply while pressing [MAIN MENU].

3. Change the security mode to the management or higher mode.

4. Select {EX. MEMORY} under the main menu.
   – The sub menu appears.
9 System Backup
9.7 Loading the Backup Data from the SD Card

- When set the (SYSTEM)- (SETUP)- (OPTIONAL FUNCTION)-(AUTO BACKUP (ACP31)) as "USE", the following sub menu appears.

5. Select (SYSTEM RESTORE).

- The BACKUP FILE LIST display appears.
6. Select the file to be loaded.
   - The dialog box appears for the AIF/ACP31 board replacement confirmation.

   ![Image of the dialog box]

   - Selecting {YES} initializes the system monitoring time.
   - Selecting {NO} to complete the loading process.

7. Select clear the system monitoring time or not.

   ![Image of the confirmation dialog box]

   - Select {YES} in the loading confirmation dialog box to start loading the contents of “CMOSBK.BIN” or “CMOSBK??,BIN” (?? denotes figures) from the SD card to the YRC1000micro CMOS.

8. Select {YES}.

9. Turn the power on, while pressing the [MAIN MENU].

10. Change the security mode to the management or higher mode.
9. System Backup
9.7 Loading the Backup Data from the SD Card

11. Select {EX. MEMORY} in the main menu.
   - The sub menu will appear.

12. Select {SYSTEM RESTORE (ACP31)}.
    - The backup-file list display will appear.
13. Select desired date file.
   - The AIF/ACP31 board dialog will appear.
   - Select (YES) when exchanged the AIF/ACP31 board. If not, select (NO).
   - When select (YES), cumulative time display will be initialized. For selecting (NO), cumulative time display will continue.

14. Select from the confirmation dialog box.
   - The dialog box appears for the loading confirmation.
   - Select (YES) to initialize the system monitoring time and loading process is executed.
   - Select (NO) to continue counting the system monitoring time and loading process is executed.

When loading process is executed, the memory device or SD card mounted on the ACP31 board is updated to the content of the file selected “CMOSBK.BIN” or “CMOSBK??..BIN” (?? denotes figures).
9 System Backup

9.7 Loading the Backup Data from the SD Card

9.7.2 Safety Board FLASH ROM Data Reset

When the procedures described in chapter 9.7 “Loading the Backup Data from the SD Card” are completed, the message “Select 'Safety Board FLASH Reset'” appears. Then, change the security to the safety mode and execute the operation described in chapter 8.26.15.2 “Safety Circuit Board FLASH ROM Data Erase and Reset”.

CAUTION

Note that by executing “SYSTEM RESTORE” or “SYSTEM RESTORE (ACP31)”, the current CMOS data in the YRC1000micro is replaced with the data of the file “CMOSBK.BIN” or “CMOSBK???.BIN” (?? denotes figures) in the external memory device.

After “CMOSBK.BIN” has been loaded, confirm that the new data is the same as the previously saved data in the CMOS. In addition, call the master job to confirm that the current manipulator position is correct and safe. After that, start operating the manipulator.
## 9.8 Error List

</tbody>
</table>
10 Upgrade Function

10.1 Functional Overview

YRC1000micro applies two software for the CPU configuration: a software for ACP31 (for the main CPU board) and a software for the programming pendant. The system works only with the combination of certain versions due to a compatibility problem of each software.

Therefore, YRC1000micro can upgrade the software for the programming pendant if the combination of the software for ACP31 and the programming pendant is invalid.

10.2 Upgrade Procedure

10.2.1 Confirmation of Software Version

The compatibility of the versions of ACP31 and the programming pendant are automatically checked in 20 seconds after the YRC1000micro power supply is turned on.

- In case the versions of ACP31 and the programming pendant matches.

1. Automatic upgrade process completes and the communication process between ACP31 and the programming pendant is restarted.
10 Upgrade Function
10.2 Upgrade Procedure

2. Initial window appears approx. 60 seconds later.

The time until the initial window appears on the programming pendant may be longer if the system configuration includes an optional circuit board or if the Ethernet port for general purpose is enabled, etc.
10.2.2 Automatic Upgrade of the Programming Pendant

In case that the pendant application version of the programming pendant is older than the one of SD card in ACP31 or the pendant application version of the programming pendant is not compatible to the one of ACP31, the programming pendant is automatically upgraded.

Not only the application software but the OS of the Programming Pendant is also upgraded automatically.
(OS: Operating System)

1. After the automatic upgrade process is completed, the communication process between ACP31 and the programming pendant is restarted.
   - The programming pendant is restarted depending on the upgraded software.
     In this case, the communication process between the programming pendant and ACP31 starts again after restart of the programming pendant is done.

2. Initial window appears approx. 60 seconds later.

   ![Auto Upgrade](image)
   
   Do not turn the power off.

   Every time the OS is upgraded automatically, restart is done. There is no need of calibrating because the calibration data is taken over.

   If start the YRC1000micro without the auto upgrade process, press all of the [Interlock]+[5]+[Select] keys on the programming pendant at the same time to start.
DO NOT turn off the main power supply during automatic upgrade process.

In case the main power supply is turned off, exercise the following process.

• Turn on the main power supply of YRC1000micro.
  – Automatic upgrade might be exercised again.

• In case error occurs during automatic upgrade process.
  1. Prepare SD card for upgrading or USB memory.
  2. Press [2]+[8]+[HIGH SPEED] of the programming pendant at the same time. 
     - Upgrade of the OS of Programming Pendant
  3. Press [INTERLOCK]+[8]+[SELECT] of the programming pendant at the same time and upgrade.
     - Refer to “YRC1000micro UPGRADE PROCEDURE MANUAL (HW1484484)” for detail.

• If no recovery is made with all the operation above, replace the programming pendant.
10.3 Error Message

If Error occurs while automatic upgrading, exercise the following procedure.

- Turn on the main power supply of YRC1000micro.
  - Automatic upgrade might be exercised again.
- In case error occurs during automatic upgrade process.
  (1) Prepare SD card or USB memory for upgrading.
  (2) Press [2]+[8]+[HIGH SPEED] of the programming pendant at the same time.
    - Upgrade of the OS of Programming Pendant
  (3) Press [INTERLOCK]+[8]+[SELECT] of the programming pendant at the same time and upgrade.
    - Refer to "YRC1000micro UPGRADE PROCEDURE MANUAL (HW1484484)" for detail.
11 Programming Pendant

11.1 Disconnection Function

Disconnection function enables to cut off the communication between the programming pendant and the controller. Disconnection function enables only in remote mode.

1. Change the mode key to management mode.
2. Long press [Simple Menu] key to show the pop-up menu.
3. Select "Disconnect" button, and the confirmation dialog appears.
An error dialog appears if {Disconnect the Communication} is selected in other than remote mode.

4. Select {YES} to disconnect the communication between the controller and the programming pendant. After disconnecting the communication, the message is displayed.
11 Programming Pendant
11.1 Disconnection Function

5. Press “OK” on the message dialog, otherwise the window is closed automatically after 10 seconds since the window appears on the screen, and then the programming pendant startup window is displayed.

When connecting the controller and the programming pendant again, press “Connect” button.

![Programming Pendant Startup](image)

**CAUTION**

- While the programming pendant startup window is displayed (while communication between the YRC1000micro and the programming pendant is disconnected), the manipulator in operation cannot be stopped by using [HOLD]. To stop the manipulator's operation, press the emergency stop button.

- While the programming pendant startup window is displayed, the mode of the YRC1000micro cannot be changed by using the Mode Switch. To change the mode of the YRC1000micro, press "Connect" button in the startup window to connect the YRC1000micro and the programming pendant, and then turn the Mode Switch to the desired mode.
11.2 Reset Function

Reset function enables to restart only the programming pendant while the main power supply of the controller is ON.

If unable to operate the robot by the programming pendant causing from the communications error of the programming pendant, recover the programming pendant by following procedures.

1. Confirmation of the 7SEG-LED display on the JANCD-ACP31-1E
   – Check the 7SEG-LED display on the JANCD-ACP31-1E.

   • Check that an alphabet letter or a number is displayed on the 7SEG-LED display.
   • Check that a dot is displayed at the lower right of the 7SEG-LED. If it is, check that the dot is blinking or lighted.
   • If the displayed alphabet or the number is continuously changing, write down them in order.

2. Reset the programming pendant
   – Open the SD card slot cover on the programming pendant.
   – There is a small hole to the right of SD card insertion slot. Insert a spit into the hole to press the reset button.

   – The programming pendant is rebooted and it starts connecting to the controller again.
11 Programming Pendant
11.3 Touch Panel Invalidate Function

11.3 Touch Panel Invalidate Function

The touch panel invalidate function enables to invalidate the touch panel operation of the programming pendant (key operation is still valid).

Even if the touch panel is failure, it is able to prevent the mis-operation by using this function.

Operate the following procedures to valid/invalid the touch panel.

- **Invalidate the Touch Panel**
  1. Push down the [INTER LOCK]+[AUX] keys at the same time. The confirmation dialog to invalidate the touch panel appears.
  2. Move the focus area over the {YES} on the confirmation dialog by using [←] key.

When the touch panel is invalid, an icon, which shows the invalidating the touch panel, is displayed on the status area, and the message “Touch operation is invalid” is displayed on the message area.
11 Programming Pendant
11.3 Touch Panel Invalidate Function

- **Validate the Touch Panel**

  1. Push down the [INTER LOCK]+[AUX] keys at the same time.
     The confirmation dialog to validate the touch panel appears.

   ![Confirmation Dialog]

   - In the case of invalidating the touch panel, the touch panel invalidating status continues even though the power supply is turned ON/OFF.
   - To validate the touch panel again, push down the [INTER LOCK]+[AUX] keys at the same time, and then validate the touch panel on the confirmation dialog.

  2. Move the focus area over the {YES} on the confirmation dialog by using [←] key.

  3. Press [Select].
     The touch panel become valid.

---

241x824
11.4 Reboot Robot System

After changing a parameter, repairing or maintaining, following procedure to reboot the robot system.

The robot system cannot be rebooted when the servo power is ON.

Confirm that the servo power is OFF before rebooting.

1. Select {SYSTEM INFO} - {CPU RESET} in the main menu.

2. Confirm the servo power is OFF and select (RESET).
3. The confirmation dialog appears. Select {YES} to reboot the robot system.

4. If the operation to reboot the robot system is performed when the servo power is ON, the following error message appears.
   – Select “CANCEL” to cancel the error message.
12 Modification of System Configuration

12.1 Addition of I/O Modules

To add I/O modules, turn OFF the power supply.

Addition operation must be performed in the management mode. In the operation mode or editing mode, only reference of status setting is possible.

1. Turn ON the power supply again while pressing [MAIN MENU] simultaneously.
2. Change the “SECURITY MODE” to the management mode.
3. Select {SYSTEM} under the main menu.
   – The system window appears.

4. Select {SETUP}.
   – The SETUP window appears.
   – The items marked with "■" cannot be selected.
12 Modification of System Configuration

12.1 Addition of I/O Modules

5. Select (I/O MODULE).
   – The current status of the mounted I/O module is shown.

6. Confirm the status of mounted I/O module.

<table>
<thead>
<tr>
<th>ST#</th>
<th>Station address of I/O module</th>
</tr>
</thead>
<tbody>
<tr>
<td>DI</td>
<td>Number of contact input points</td>
</tr>
<tr>
<td>DO</td>
<td>Number of contact output points</td>
</tr>
<tr>
<td>AI</td>
<td>Number of analog input points</td>
</tr>
<tr>
<td>AO</td>
<td>Number of analog output points</td>
</tr>
<tr>
<td>BOARD</td>
<td>Circuit board type</td>
</tr>
</tbody>
</table>

   – 1) A hyphen, -, indicates that the corresponding I/O section is not mounted.
   – 2) If the system cannot recognize the circuit board type, a row of stars (*****) are shown. No problem will occur as long as the values displayed in DI, DO, AI, and AO are correct.

   – Confirm the statuses of the mounted I/O modules for the other stations.
8. Press [ENTER].
   – The confirmation dialog box is shown.

![Confirmation Dialog Box]

9. Select {YES}.
   – The system parameters are then set automatically according to the current mounted hardware status, and the window will be changed to the external I/O setup window.

   A message “Select ‘Safety Board FLASH Reset’” in the human interface area. However, do not select/perform Safety Board FLASH Reset at this point.

   **NOTE**
   If there is a difference between the displayed contents and the actual mounted status, confirm the status again. If the status is correct, the I/O module may be defective: in such a case, contact your YASKAWA representative.
12.2 Allocating External I/O Signal

1. The EXTERNAL I/O SETUP window appears.

2. Select “AUTO” or “MANUAL” under the ALLOCATION MODE.
   – The selected menu appears.

   ![Diagram showing selection process]

   **NOTE**
   When the allocation mode is changed from “MANUAL” to “AUTO”, the set allocation data is discarded, and re-allocation in the Auto mode takes place. If it is necessary to save the set allocation data, save it using the external memory menu in advance.
3. Select the allocation mode to set.
   - To operate the I/O signal allocation automatically, select the allocation mode “AUTO”.
   - To operate the I/O signal allocation manually, select the allocation mode “MANUAL”.
   - Selected allocation mode appears.

4. Select “DETAIL” under the “EXTERNAL IO ALLOCATION”.
   - The External Input Signals Allocation window appears.
   - When select the “AUTO”, skip the following procedures from No. 5 to No. 7. Operate from the procedure No. 8.
   - S for the allocation mode “MANUAL”, operate the following procedures.
5. Select the external input signal number (at the change source) to be changed. (In the setting example, select “#20010”.)
   - The select menu appears.

6. Select “MODIFY”, and input the external input signal number (at the change destination) to be changed. (In the setting example, enter ‘20190’.)
   - The external I/O signal is changed.

7. Likewise, select/modify the number of the external input signal.
   - Repeat select/modify until it becomes the desired allocation.
8. Press [ENTER].
   – The External Output Signals Allocation window appears.

9. Like the case of the external input signal, select/modify the external output signal.
   – Repeat select/modify until it becomes the desired allocation.

10. Press [ENTER].
    – The confirmation dialog box appears.

11. Select {YES}.
    – The settings are confirmed, and the SETUP window reappears.
12. Change the security mode to safety mode

13. Select {FILE} - {INITIALIZE} under the main menu.
   – The initialize window appears.

14. Select “Safety Board FLASH Reset”.
   – A confirmation dialog box appears.

15. Select (YES).
   – When a message “Select ‘Safety Board FLASH Reset’” in the human interface area dissappeared resetting of Safety Board FLASH Reset is complete.
12.2 Allocating External I/O Signal

- **Explanation about the External I/O Signal Allocation Window**
  The details of the window are explained using the window example. The range over which the cursor can move is the hatched area of the figure.

</table>

1. **External I/O signal numbers**
   Indicates the beginning number of the external I/O signals allocated to each I/O area. On the allocation window, the set values of these items are used and displayed in ascending order. The following contents are displayed.
   - #20010 to #25120: The number of the signal allocated to the beginning of each I/O area, in the input signals
   - #30010 to #35120: The number of the signal allocated to the beginning of each I/O area, in the output signals
   - #-----: Unallocated I/O area

2. **ST#**
   Indicates the YRC1000 micro station number allocated to each I/O board. The displayed contents include the following:
   - 0: Safety IO I/F board (JANCD-ASF3□-1E)
   - 16: The first field bus board
     (Normally, optional board inserted into the optional slot at the left side.)
   - 17: The second field bus board
     (Normally, optional board inserted into the optional slot at the right side.)

3. **CH**
   Indicates the channel number (network communication system) on the board. The following contents are displayed.
   - 0: I/O area for channel 1
   - 1: I/O area for channel 2
12 Modification of System Configuration
12.2 Allocating External I/O Signal

MAC ID
Indicates the network communication station number set in the channel concerned on the board concerned. Regarding station numbers that cannot be displayed, or station numbers that do not need to be displayed, ‘0’ is displayed. The following contents are displayed.
0 : No station number, or network communication station number ‘0’
Scanner station of EtherNet/IP (CPU board)
1 to 251 : Network communication station number ‘1’ to ‘251’
Adapter station of EtherNet/IP (CPU board)
(Scanner allocation number sequence)
252 : Unallocated I/O area of channel 1
253 : Unallocated I/O area of channel 2
254 : Communication status area of channel 1
255 : Communication status area of channel 2

ADDR
Indicates the offset address from the beginning of each I/O area when the inside of each I/O area is further divided into multiple parts.

BYTE
Indicates the size (number of bytes) inside each I/O area.

NAME
Indicates the name of each I/O board.
12.3 Addition of Base and Station Axes

To add the base and station axes, mount all hardware correctly and then execute maintenance mode.

Addition operation must be performed in the management mode.
In the operation mode or editing mode, only reference of status setting is possible.

When adding a base and a station axis, set the following items:

- **TYPE**
  - Select one in the type list.
    - In case of base axis (B1, B2)
      Select one of RECT-X, -Y, -Z, -XY, -XZ, -YZ or -XYZ.
    - In case of station axis (S1, S2, S3)
      Select UNIV-* ("*" represents the number of axes) when using a mechanism other than the registered type as a station axis.

- **CONNECTION**
  - In the CONNECTION window, specify the SERVOPACK which is connected with each axis group, the contactor which is used for the SERVOPACK, and the overrun signal (OT).

- **AXIS TYPE**
  - Select from the axis type list.
    - In case of TURN-* type
      No need to select (The axis type is set as TURN type.)
    - In case of RECT-* type
      Select BALL-SCREW type or RACK & PINION type.
    - In case of UNIV-* type
      Select BALL-SCREW type, RACK & PINION type or TURN type.

- **MECHANICAL SPECIFICATION**
  - If axis type is ball-screw type, set the following items:
    - MOTION RANGE (+) [mm]
    - MOTION RANGE (-) [mm]
    - REDUCTION RATIO (numerator)
    - REDUCTION RATIO (denominator)
    - BALL-SCREW PITCH [mm/r]
12.3 Addition of Base and Station Axes

• If axis type is rack & pinion type, set the following items.
  • MOTION RANGE (+) [mm]
  • MOTION RANGE (-) [mm]
  • REDUCTION RATIO (numerator)
  • REDUCTION RATIO (denominator)
  • PINION DIAMETER [mm]

• If axis type is turn type, set the following items.
  • MOTION RANGE (+) [deg]
  • MOTION RANGE (-) [deg]
  • REDUCTION RATIO (numerator)
  • REDUCTION RATIO (denominator)
  • OFFSET (1st and 2nd axis) [mm]

• MOTOR SPECIFICATION
Set the following items.
  • MOTOR
  • SERVO AMP
  • CONVERTER
  • ROTATION DIRECTION [normal/reverse]
  • MAX. RPM [rpm]
  • ACCELERATION SPEED [sec]
  • INERTIA RATIO

* Select MOTOR, AMPLIFIER and CONVERTER from each type list on the display.
12.3 Addition of Base and Station Axes

12.3.1 Base Axis Setting

12.3.1.1 Selection of Base Axis Type

Select the type of base axis to be added/modified.

1. Turn ON the power supply again while pressing [MAIN MENU] simultaneously.
2. Change the “SECURITY” to the “MANAGEMENT MODE”.
3. Select {SYSTEM} under the main menu.
   - The system window appears.
4. Select {SETUP}.
   - The SETUP window appears.
   - Note that the items marked with "■" cannot be set.
5. Select [CONTROL GROUP].

- The current control group type is displayed.

6. Move the cursor to the type of control group to be modified, and press [SELECT].

- The MACHINE LIST window is displayed.
12. Modification of System Configuration

12.3 Addition of Base and Station Axes

7. Select one in the type list.
   – After the type selection, the window returns to the CONNECT window.

RECT-X

Base axis direction of travel coincides with robot coordinate X-Axis.

RECT-Y

Base axis direction of travel coincides with robot coordinate Y-Axis.

RECT-Z

Base axis direction of travel coincides with robot coordinate Z-Axis.

RECT-X

Base 1st and 2nd axes directions of travel coincide with robot coordinate X-Axis and Y-Axis, respectively.

RECT-Y

Base 1st and 2nd axes directions of travel coincide with robot coordinate Y-Axis and Z-Axis, respectively.

RECT-Z

Base 1st and 2nd axes directions of travel coincide with robot coordinate X-Axis and Z-Axis, respectively.

RECT-X

Base 1st, 2nd, and 3rd axes directions of travel coincide with robot coordinate X-Axis, Y-Axis, and Z-Axis, respectively.
12.3.1.2 Connection Setting

In the CONNECT window, it is specified that each axis of each control group is connected to which connector of the SERVO board, which brake of the contactor unit, which converter, and which overrun signal.

1. Confirm the type of each control group in the CONNECT window.

2. Select the connection item of a desired control group.
   - The settable items are displayed.
   - Select an item to change the setting. Select {Cancel} to return to the CONNECT window.

   - Specify which connector (CN) of the SERVO board each axis of each control group is connected to.
     The numbers in [ ] represent axis numbers, and indicate which axis is connected to which connector.

   - Specify which brake (BRK) of the contactor unit each axis of each control group is connected to.
     The numbers in [ ] represent the axis numbers, and indicate which axis is connected to which brake.
12 Modification of System Configuration

12.3 Addition of Base and Station Axes

– Specify which converter (CV) each axis of each control group is connected to.
   The numbers in [] represent the converter numbers, and indicate which axis is connected to which converter.

– Specify which overrun signal (OT) each control group is connected to.

– In this example described in the step 2 in the previous page, B1 (Base) is connected in the following manner:

1st axis → SERVO Board (SV #1), Connector (8CN),
            Brake Connector (BRK8), Converter (CV #1)

2nd axis → SERVO Board (SV #1), Connector (9CN)
            Brake Connector (BRK9), Converter (CV #1)

Overrun → (OT1)

3. Therefore, when an overrun alarm occurs, the subcode is indicated by the control group. However, select “NOT CONNECT” if an overrun switch is not installed to the control group or the allocation of the external axis overrun signal is not needed.

4. Select a desired item.

5. Press [ENTER] in the CONNECT window.
   – The setting in the CONNECT window is completed and the window moves to the AXES CONFIG window.
12.3.1.3 Axis Configuration Setting

The axis type is specified in the AXES CONFIG window.

1. Confirm axis type of each axis in the AXES CONFIG window.
   - The axis type of each axis is displayed.

2. Select the axis type to be modified.
   (1) The settable axis type is displayed.

   ![AXES CONFIG Window](image)

   (2) Select “BALL-SCREW” when the servo track is ball-screw type, and “RACK&PINION” when the servo track is rack & pinion type. After the selection, the window returns to the AXES CONFIG window.

   (3) Select the axis type.

4. The setting in the AXES CONFIG window is completed and the window moves to the MECHANICAL SPEC window.
12.3.1.4 Mechanical Specification Setting

The mechanical data is specified in the MECHANICAL SPEC window.

1. Confirm specification of each axis in the MECHANICAL SPEC window.
   - The mechanical specification of axis is shown.

The MECHANICAL SPEC window (in case of the BALL-SCREW type)

- MOTION RANGE : Input maximum moving position (positive (+) direction and negative (-) direction) from home position when setting the home position to 0. (Unit: mm)

- REDUCTION RATIO : Input the numerator and the denominator. <e.g.> If the reduction ratio is 1/2, the numerator should be set as 1.0 and the denominator should be set as 2.0.

- BALL-SCREW PITCH : Input the traveling length when the ball-screw rotates once. (Unit: mm/r)

The MECHANICAL SPEC window (in case of the RACK&PINION type)

- MOTION RANGE : Input maximum moving position (positive (+) direction and negative (-) direction) from home position when setting the home position to 0. (Unit: mm)

- REDUCTION RATIO : Input the numerator and the denominator. <e.g.> If the reduction ratio is 1/120, the numerator should be set as 1.0 and the denominator should be set as 120.0.

- PINION DIAMETER : Input the diameter of a pinion. (Unit: mm)
12 Modification of System Configuration
12.3 Addition of Base and Station Axes

2. Select the item to be modified.
   – Point the cursor to the item subject for setting value modification, and press [SELECT].

3. Modify the settings.
   – The selected item is in the input status.
   Input the setting value, and press [ENTER].

   – After the setting, the current window moves to the window for the next axis setting. Complete the settings for all axes in the same manner.
   – When [ENTER] is pressed in the MECHANICAL SPEC window for the last axis, the setting in the MECHANICAL SPEC window is completed and the window moves to the MOTOR SPEC window.
12.3.1.5 Motor Specification Setting

The motor data is specified in the MOTOR SPEC window.

1. Confirm specification of each axis in the MOTOR SPEC window.
   - The motor specification of each axis is displayed.

   ![Motor Specification Window]

2. Select the desired item.
   - When a numerical value is selected, the number input buffer line appears.
   - When MOTOR (or SERVO AMP or CONVERTER) is selected, the list window of MOTOR (SERVO AMP, or CONVERTER) appears.
   - ROTATION DIRECTION: Set the rotation direction to which the current position is increased. (The counterclockwise view from the loaded side is the normal rotation.)

   ![AC Servo Motor]

   - MAX. RPM: Input maximum rotation speed of a motor. (Unit: rpm)
   - ACCELERATION TIME: Input time between 0.01 and 1.00 to reach maximum speed from stopping status at 100% JOINT speed. (Unit: sec)
   - INERTIA RATIO: The initial value is set at 300 in case of servo track; 0 in case of rotation axis. However, if the following phenomenon occurs in motion, deal with the following procedure.

   - <Phenomenon1>
     During motion, the axis moves unsteady on advance direction.
     Confirm the motion with increasing this ratio in each 100.
12 Modification of System Configuration
12.3 Addition of Base and Station Axes

- <Phenomenon2>
  During pause, the motor makes a lot of noise.
  ➔ Confirm the motion with decreasing this ratio in each 100.

3. Modify the settings.

   - After the setting, the current window moves to the window for the next axis setting. Complete the settings for all axes in the same manner.
   - When [ENTER] is pressed in the MOTOR SPEC window for the last axis, the setting in the MOTOR SPEC window is completed and the confirmation dialog box appears.

- If {YES} is selected, the system parameter is set automatically.

5. Initialize the related files.
   - To add and modify the base axis in completed.

6. Change the security mode to safety mode.
7. Select {FILE} - {INITIALIZE} under the main menu.
   – The initialize window appears.

8. Select “Safety Board FLASH Reset”.
   – A confirmation dialog box appears.

9. Select {YES}.
   – When a message “Select ‘Safety Board FLASH Reset’” in the human interface area dissappeared resetting of Safety Board FLASH Reset is complete.
12.3.2 Station Axis Setting

12.3.2.1 Selection of Station Axis Type

Select the type of station axis to be added/modified.

1. Confirm the type of control group in CONTROL GROUP window.
   - The CONTROL GROUP window appears.

2. Select the type of control group to be modified.
   - The MACHINE LIST window appears.
3. Select desired type in the type list.
   - After the type selection, the window returns to CONNECT window.
   - Select “UNIV” (universal) when using a mechanism other than the registered type (such as a servo track) as a station axis. When “UNIV” is selected, interpolation motion (linear, circular, etc.) is not supported.
12.3.2.2 Connection Setting

In the CONNECT window, it is specified that each axis of each control group is connected to which connector of the SERVO board, which brake of the contactor unit, which converter, and which overrun signal.

1. Confirm the type of each control group in the CONNECT window.

2. Connection status of each control group is displayed. Select the connection item of desired control group.
   - The settable items are displayed.
   - Select an item to change the setting. Select {Cancel} to return to the CONNECT window.

   - Specify which connector (CN) of the SERVO board each axis of each control group is connected to. The numbers in [ ] represent axis numbers, and indicate which axis is connected to which connector.

   - Specify which brake (BRK) of the contactor unit each axis of each control group is connected to. The numbers in [ ] represent the axis numbers, and indicate which axis is connected to which brake.

   - Specify which converter (CV) each axis of each control group is connected to. The numbers in [ ] represent the converter numbers, and indicate which axis is connected to which converter.

   - Specify which overrun signal (OT) each control group is connected to.

   - In this example, S1 (Station) is connected in the following manner:

     - 1st axis → SERVO Board (SV #1), Connector (7CN), Brake Connector (BRK7), Converter (CV #2)
     - 2nd axis → SERVO Board (SV #1), Connector (8CN), Brake Connector (BRK8), Converter (CV #3)
     - Overrun → (OT1)
3. An overrun signal is allocated to a control group. Therefore, when an overrun alarm occurs, the subcode is indicated by the control group. However, select “NOT CONNECT” if an overrun switch is not installed to the control group or the allocation of the external axis overrun signal is not needed.

4. Select a desired item.

5. Press [ENTER] in the CONNECT window.
   – The setting in the CONNECT window is completed and the window moves to the AXES CONFIG window.
12.3.2.3 Axis Configuration Setting

The axis type and motor type are specified in the AXES CONFIG window.

1. Confirm axis type of each axis in the AXES CONFIG window.
   - The axis type of each axis is displayed.
     • The AXES CONFIG window (in case of the TURN type)

     ![AXES CONFIG window (TURN type)](image)

     when axis type is "ROTATION", the axis type cannot be changed.

     BALL-SCREW: Traverse axis (ball-screw)
     RACK&PINION: Traverse axis (rack&pinion)
     ROTATION: Rotation axis

     • The AXES CONFIG window (in case of the UNIVERSAL type)

     ![AXES CONFIG window (UNIVERSAL type)](image)
2. Select the axis type to be modified.
   – The settable axis type is displayed.

3. Select the desired axis type.

4. Press [ENTER] in the AXES CONFIG window
   – The setting in the AXES CONFIG window is completed and the window moves to the MECHANICAL SPEC window.
12.3.2.4 Mechanical Specification Setting

The mechanical data is specified in the MECHANICAL SPEC window.

1. Confirm specification of each axis in the MECHANICAL SPEC window.
   - The mechanical specification of axis is shown.

   - MOTION RANGE: Input maximum moving position (positive (+) direction and negative (-) direction) from home position when setting the home position to 0. (Unit: deg)

   - REDUCTION RATIO: Input the numerator and the denominator. 
     <e.g.> If the reduction ratio is 1/120, the numerator should be set as 1.0 and the denominator should be set as 120.0.

   - OFFSET: Offset should be specified at “TURN-2” type only. Input length between the center of bending axis (1st axis) and the turning table (2nd axis). (Unit: mm)
12.3 Addition of Base and Station Axes

- The MECHANICAL SPEC window (In case of the BALL-SCREW type)

- **MOTION RANGE**: Input maximum moving position (positive (+) direction and negative (-) direction) from home position when setting the home position to 0. (Unit: mm)

- **REDUCTION RATIO**: Input the numerator and the denominator. [e.g.] If the reduction ratio is 1/2, the numerator should be set as 1.0 and the denominator should be set as 2.0.

- **BALL-SCREW PITCH**: Input the traveling length when the ball-screw rotates once. (Unit: mm/r)

- The MECHANICAL SPEC window (In case of the RACK&PINION type)

- **MOTION RANGE**: Input maximum moving position (positive (+) direction and negative (-) direction) from home position when setting the home position to 0. (Unit: mm)

- **REDUCTION RATIO**: Input the numerator and the denominator. [e.g.] If the reduction ratio is 1/120, the numerator should be set as 1.0 and the denominator should be set as 120.0.

- **PINION DIAMETER**: Input the diameter of a pinion. (Unit: mm)
12 Modification of System Configuration
12.3 Addition of Base and Station Axes

- The MECHANICAL SPEC window (In case of the ROTATION type)

- **MOTION RANGE**: Input maximum moving position (positive (+) direction and negative (-) direction) from home position when setting the home position to 0. (Unit: deg)

- **REDUCTION RATIO**: Input the numerator and the denominator. <e.g.> If the reduction ratio is 1/120, the numerator should be set as 1.0 and the denominator should be set as 120.0.

2. Modify the settings.

   - After the setting, the current window moves to the window for the next axis setting. Complete the settings for all axes in the same manner. When [ENTER] is pressed in the MECHANICAL SPEC window for the last axis, the setting in the MECHANICAL SPEC window is completed and the window moves to the MOTOR SPEC window.
12.3.2.5 Motor Specification Setting

The motor data is specified in the MOTOR SPEC window.

1. Confirm specification of each axis in the MOTOR SPEC window.
   - The motor specification of each axis is displayed.
   - When a numerical value is selected, the number input buffer line appears.
   - When MOTOR (or SERVO AMP or CONVERTER) is selected, the list window of MOTOR (SERVO AMP or CONVERTER) appears.
   - When the type is selected, the window returns to the MOTOR SPEC window.
   - ROTATION DIRECTION: Set the rotation direction to which the current position is increased.
     (The counterclockwise view from the loaded side is the normal rotation.)

   ![Fig. 12-2: AC Servo Motor](image)

   - MAX. RPM: Input maximum rotation speed of a motor. (Unit: rpm)
   - ACCELERATION SPEED: Input time between 0.01 and 1.00 to reach maximum speed from stopping status at 100% JOINT speed. (Unit: sec)
12 Modification of System Configuration
12.3 Addition of Base and Station Axes

- **INERTIA RATIO**: The initial value is set at 300 in case of servo track; 0 in case of rotation axis. However, if the following phenomenon occurs in motion, deal with the followed procedure.

- **<Phenomenon1>** During motion, the axis moves unsteady on advance direction.
  → Confirm the motion with increasing this ratio in each 100.

- **<Phenomenon2>** During pause, the motor makes a lot of noise.
  → Confirm the motion with decreasing this ratio in each 100.

3. Modify the settings.
   A message “Select ‘Safety Board FLASH reset’” is shown on the human inter face area after adding/changing of the station axis operation, perform “Safety Board FLASH reset” by following the procedures below.

4. Change the security mode to the safety mode.

5. Select (FILE) - (INITIALIZE) under the main menu.

6. Select “Safety board FLASH Reset”.

---

12-34
12 Modification of System Configuration
12.3 Addition of Base and Station Axes

– A confirmation dialog box

7. Select {YES}.
– When the message “Select ‘Safety Board FLASH Reset’” in the human interface area dissappeared resetting of Safety Board FLASH Reset is complete.

NOTICE

• If the control axis configuration is changed by addition of a base axis or station axis, the internal data of the job file are also changed so that the job file data should be initialized. Initialize the job file data with procedure “File Initialize” in this manual after changing the construction.

• When the data, motion range for example, should be changed after the addition of a base axis or station axis, the change can be done in the same procedure as shown above. In this case, the control axis configuration is not changed so the job file data should not be initialized.
DANGER

- Always set the teach lock before starting teaching.
- Observe the following precautions when performing teaching operations within the P-point maximum envelope of the manipulator:
  - Be sure to perform lockout by putting a lockout device on the safety fence when going into the area enclosed by the safety fence. In addition, the operator of the teaching operation must display the sign that the operation is being performed so that no other person closes the safety fence.
  - View the manipulator from the front whenever possible.
  - Always follow the predetermined operating procedure.
  - Always keep in mind emergency response measures against the manipulator’s unexpected movement toward a person.
  - Ensure a safe place to retreat in case of emergency.

Failure to observe this instruction may cause improper or unintended movement of the manipulator, which may result in personal injury.

- Before operating the manipulator, make sure the servo power is turned OFF by performing the following operations. When the servo power is turned OFF, the SERVO ON LED on the programming pendant is turned OFF.
  - Press the emergency stop buttons on the front door of the YRC1000micro, on the programming pendant, on the external control device, etc.
  - Disconnect the safety plug of the safety fence. (when in the play mode and the remote mode)

If operation of the manipulator cannot be stopped in an emergency, personal injury and/or equipment damage may result.

DANGER

- In the case of not using the programming pendant, be sure to supply the emergency stop button on the equipment. Then before operating the manipulator, check to be sure that the servo power is turned OFF by pressing the emergency stop button. Connect the external emergency stop button to the 4-14 pin and 5-15 pin of the Safety connector (Safety).
- Upon shipment of the YRC1000micro, this signal is connected by a jumper cable in the dummy connector. To use the signal, make sure to supply a new connector, and then input it.

If the signal is input with the jumper cable connected, it does not function, which may result in personal injury or equipment damage.
WARNING

• When turning ON the YRC1000micro power, confirm that no person is present in the manipulator's operating range and that the operator is in a safe location. Personal injury may result if a person enters the manipulator's operating range during operation. Immediately press an emergency stop button whenever there is a problem. The emergency stop button is located on the upper right of the programming pendant.

• Perform the following inspection procedures prior to conducting manipulator teaching. If there is any problem, immediately take necessary steps to solve it, such as maintenance and repair.
  – Check for a problem in manipulator movement.
  – Check for damage to insulation and sheathing of external wires.

• Return the programming pendant to a safe place after use. If the programming pendant is left unattended on the manipulator, on a fixture, or on the floor, etc., the Enable Switch may be activated due to surface irregularities of where it is left, and the servo power may be turned ON. In addition, in case the operation of the manipulator starts, the manipulator or the tool may hit the programming pendant left unattended, which may result in personal injury and/or equipment damage.

• Make sure that a system administrator stores the key of the Mode Switch of the programming pendant. After operation is completed, the key must be removed and stored by the system administrator. Failure to observe this instruction may result in personal injury due to inappropriate or unintended manipulator's operation. If the programming pendant is dropped with the key inserted, the key or the Mode Switch may be damaged.

14 Description of Units and Circuit Boards

**DANGER**

- Always set the teach lock before starting teaching.
- Observe the following precautions when performing teaching operations within the P-point maximum envelope of the manipulator:
  - Be sure to perform lockout by putting a lockout device on the safety fence when going into the area enclosed by the safety fence. In addition, the operator of the teaching operation must display the sign that the operation is being performed so that no other person closes the safety fence.
  - View the manipulator from the front whenever possible.
  - Always follow the predetermined operating procedure.
  - Always keep in mind emergency response measures against the manipulator’s unexpected movement toward a person.
  - Ensure a safe place to retreat in case of emergency.

Failure to observe this instruction may cause improper or unintended movement of the manipulator, which may result in personal injury.

- Before operating the manipulator, make sure the servo power is turned OFF by performing the following operations. When the servo power is turned OFF, the SERVO ON LED on the programming pendant is turned OFF.
  - Press the emergency stop buttons on the programming pendant, or on the external control device, etc.
  - Disconnect the safety plug of the safety fence. (when in the play mode and the remote mode)

If operation of the manipulator cannot be stopped in an emergency, personal injury and/or equipment damage may result.

**DANGER**

- In the case of not using the programming pendant, be sure to supply the emergency stop button on the equipment. Then before operating the manipulator, check to be sure that the servo power is turned OFF by pressing the emergency stop button. Connect the external emergency stop button to the 4-14 pin and 5-15 pin of the Safety connector (Safety).
- Upon shipment of the YRC1000micro, this signal is connected by a jumper cable in the dummy connector. To use the signal, make sure to supply a new connector, and then input it.

If the signal is input with the jumper cable connected, it does not function, which may result in personal injury or equipment damage.
WARNING

• When turning ON the YRC1000micro power, confirm that no person is present in the manipulator's operating range and that the operator is in a safe location.

Personal injury may result if a person enters the manipulator's operating range during operation. Immediately press an emergency stop button whenever there is a problem. The emergency stop button is located on the upper right of the programming pendant.

• Perform the following inspection procedures prior to conducting manipulator teaching. If there is any problem, immediately take necessary steps to solve it, such as maintenance and repair.
  – Check for a problem in manipulator movement.
  – Check for damage to insulation and sheathing of external wires.

• Return the programming pendant to a safe place after use.

If the programming pendant is left unattended on the manipulator, on a fixture, or on the floor, etc., the Enable Switch may be activated due to surface irregularities of where it is left, and the servo power may be turned ON. In addition, in case the operation of the manipulator starts, the manipulator or the tool may hit the programming pendant left unattended, which may result in personal injury and/or equipment damage.

• Make sure that a system administrator stores the key of the Mode Switch of the programming pendant. After operation is completed, the key must be removed and stored by the system administrator.

Failure to observe this instruction may result in personal injury due to inappropriate or unintended manipulator's operation. If the programming pendant is dropped with the key inserted, the key or the Mode Switch may be damaged.
Cautions for connection of dual input signals

- To the dualized specific signal, connect the switch (contact) that turns the signal ON and OFF simultaneously.
- If the timing of turning ON and OFF between the dualized signals, a disagreement alarm occurs.
- Do not connect two signals to the same contact point. (Prepare two independent contact points)
- Since the power supply for each signal is reversed, it will short-circuit and may cause breakdown of YRC1000micro Unit if the signals are connected to the same contact point.
14.1 Connection for Connector on Front Panel

Connectors are arranged on the front panel of the YRC1000micro for the various signal connections.

*Fig. 14-1: Front Panel View of the YRC1000micro*

![Diagram of YRC1000micro front panel showing various connectors and components.]

14.1.1 Connection of Robot Specific Input Signal

A connector to input the robot specific signal is arranged on the front panel of the YRC1000micro.

For the connections, refer to figure below.

*Fig. 14-2: Location of the Input Connector for the Robot System Signal*
14 Description of Units and Circuit Boards

14.1 Connection for Connector on Front Panel

- Pin Assignment of the pin for the Robot Specific Signal Input Connector (SAFETY)

Connector types used when preparing the cable for connecting to the robot specific signal are listed below.

Upon shipment of the YRC1000micro, a dummy connector which short-circuits each specific signal is attached.

To input a specific signal, prepare the appropriate connector for the signal.

For unused signals, connect a jumper cable as when the YRC1000micro is shipped.

14-5
14.1.1.1 Connection of Safety Plug Signal (SAFF)

This is the signal to turn OFF the servo power when the gate of the safety fence opens.

Connect the interlock signal such as the safety plug, etc. which is mounted on the gate of the safety fence.

When the interlock signal is OPEN, the servo power turns OFF and the servo power cannot be turned ON.

As this is disabled in the teach mode, make sure that nobody enters inside the safety fence.

Upon shipment of the YRC1000micro, this signal is connected by a jumpercable in the dummy connector.

When operating a manipulator, prepare a new connector and wire the safety fence signal.

For the unused robot specific input signal, connect a jumpercable as when the YRC1000micro is shipped.

**DANGER**

- Upon shipment of the YRC1000micro, this signal is connected by a jumpercable in the dummy connector. To use the signal, make sure to supply a new connector, and then input it.

If the signal is input with the jumpercable connected, it does not function, which may result in personal injury or equipment damage.

Turn ON/OFF simultaneously
Installation example of safety plug

Install a safety fence and a door with the interlock function around the manipulator so that an operator cannot enter inside the fence unless the door is opened. And at the same time make sure that the interlock function stops the manipulator operation when the door is opened.

The safety plug input signal is the signal to connect this interlock signal.

Fig. 14-4: Installation Example of Safety Plug

While the servo power is ON and the interlock signal is input, the servo power is turned OFF. (The servo power cannot be turned ON while the interlock signal is being input.)

Note that the servo power does not turn OFF only in the teach mode. (The servo power can be turned ON even while the interlock signal is input.)
14.1.1.2 Connection of External Emergency Stop Signal (EXESP)

This signal is used to connect the emergency stop switch for the external devices, etc.

When the contact is OPEN, the servo power is turned OFF and execution of the job is stopped.

While the signal is being input, the servo power cannot be turned ON.

Upon shipment of the YRC1000micro, this signal is connected by a jumper cable in the dummy connector.

When operating the manipulator, prepare a new connector and wire the safety fence signal.

For unused robot specific input signals, connect a jumper cable as when the YRC1000micro is shipped.

**DANGER**

- Upon shipment of the YRC1000micro, this signal is connected by a jumper cable in the dummy connector. To use the signal, make sure to supply a new connector, and then input it.

If the signal is input with the jumper cable connected, it does not function, which may result in personal injury or equipment damage.

---

*Fig. 14-5: Connection for External Emergency Stop Signal (EXESP)*
14.1.1.3 Protection Stop (ONEN) Signal Connection

For safety, connect this signal line when using the function to immediately turn OFF the servo power to all of the control groups that are connected to the robot controller when the servo power is turned ON.

- If the contact is OPEN, the servo power will turn OFF.
- When the YRC1000micro is shipped, pin terminals will already be connected to the Safety1 connector of the manipulator cable.
- Since the input for the Protection Stop signal is a dual configuration for safety, connect the contacts so that the signals of the two systems are turned ON and OFF simultaneously.
- If one of the signals for the two systems is turned ON, an alarm occurs.

**DANGER**

- Upon shipment of the YRC1000micro, this signal line is connected to pin terminals. To use the signal, make sure to remove the pin terminals, and then input it.

If the signal is input with the pin terminals connected, it does not function, which may result in personal injury or equipment damage.

*Fig. 14-6: Protection Stop (ONEN) Signal Connection*
14.1.1.4 Connection of Emergency Stop Button Contact Output Signal (ESPOUT)

This signal is used to output the emergency button contact when the programming pendant is used.

This emergency stop output is always enabled regardless of whether the YRC1000micro power supply is ON/OFF

(State output signal: Normal Close contact)

**NOTICE**

- Do not use the emergency stop button with 24 VAC, 250 mA or more.
- When connect the inductive load, such as the relay, with the output circuit, use of the built-in protective circuit for the surge suppressor or connect the flyback diode in parallel to the inductive load to suppress the surge voltage.

Failure to observe this instruction may result in damage to equipment.

*Fig. 14-7: Connection for Emergency Stop Button Contact Signal (ESPOUT)*

![Diagram showing the connection for Emergency Stop Button Contact Signal (ESPOUT)]
14.1.2 Connection of GP I/O

The Direct-in signal is equipped on the front panel of the YRC1000micro as its standard specification. And this signal is used when inputting a highly responsive signal for digital I/O (robot GP I/O) for search function, etc.

- GP I/O point: 8 inputs and 8 outputs
- Direct-in point: 4 inputs

*Fig. 14-8: Position of GP I/O Connector*

The GP I/O signal is used mainly in the motion job of the manipulator and used as a timing signal between the manipulator and peripheral devices.

Connector types used when preparing a cable for connecting to the GP I/O and Direct-in signal are listed below.

<table>
<thead>
<tr>
<th>Item</th>
<th>Type</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>The YRC1000micro-side connector</td>
<td>10250-52A2PL</td>
<td>Manufactured by Sumitomo 3M Limited</td>
</tr>
<tr>
<td>Cable-side connector</td>
<td>10150-3000PE (Connector body)</td>
<td>10350-52A0-008 (Shell jackscrew type)</td>
</tr>
</tbody>
</table>

For the details of the pin assignment, refer to *fig. 14-8 “Position of GP I/O Connector”*
When connecting an inductive load to the output circuit, connect a flyback (snubber) diode in parallel to the inductive load to suppress the surge voltage. Not using the flyback (snubber) diode may damage the output circuit.

When connecting the load with a large inrush current such as the lamp, connect the current limiting resistor in series to the load, so that the output current does not exceed its maximum value. Exceeding the maximum output current value may damage the output circuit.

Refer to chapter 14.2 “Specific I/O Signal List” about the maximum current of the transistor and the relay output circuits.
**Example of Servo ON Sequence Circuit from External Device**

Only the rising edge of the servo ON signal is valid. This signal turns ON the manipulator servo power supply. The set and reset timings are shown in the figure below.

*Fig. 14-9: Example of Servo ON Sequence Circuit from External Device*

![Servo ON Sequence Circuit from External Device](image)

**Example of Start (Start-up) Sequence Circuit from External Device**

Only the rising edge of the external start signal is valid. This signal can start the manipulator operation. Reset this signal with the interlock configuration that determines if operation can start and with the playback (RUNNING) signal confirming that the manipulator has actually started moving.

*Fig. 14-10: Example of Start Sequence Circuit from External Device*

![Start Sequence Circuit from External Device](image)

14.1 Connection for Connector on Front Panel

Fig. 14-11: Connection Diagram of GPIO Connector

- Cannot be connected to an external power supply.
14.2 Specific I/O Signal List

Inputing/Outputing of the specific signal is available only when the PSEUDO INPUT SIGNAL: 87013 is turned OFF.

And if above mentioned 87013 is turned ON, each signal can be used as GPIO.

For the details, refer to “YRC1000micro OPTIONS INSTRUCTIONS FOR Concurrent I/O (RE-CKI-A469) 7 Pseudo Input Signals”.

MECHANICAL SPEC window .......................... 12-19, 12-31, 12-32
Memory Capacity ............................................. 13-3
Modification of System Configuration ................ 12-1
Modification of Teaching Points ......................... 13-4
momentary output allocation ............................ 8-128, 8-135
MONITORING TIME ....................................... 7-3
MOTION RANGE .............................................. 12-19, 12-30, 12-31, 12-32
Motor revolution and reverse revolution ............... 8-210
MOTOR SPEC window ...................................... 12-21
Mounting the controller .................................... 3-5
Movement of the Axes ..................................... 6-3
## Index

### Moving the MOTOMAN
- 1-15

### M-SAFETY SIGNAL ALLOC
- 7-4

### N

- Noise Filter ................................................................. 4-4
- Noise level ............................................................. 13-3
- Number of Tool Files ...................................................... 8-22
- Numeric Key Customize Function .................................... 8-127

### O

- One time manage mode .................................................. 7-1
- One time management mode ........................................... 7-8
- OPERATE COND. ............................................................. 7-4
- OPERATE ENABLE ........................................................ 7-4
- Operation Instructions ..................................................... 13-5
- Operation Mode ............................................................. 7-1
- Operation Time Display ................................................. 13-4
- Order Number ............................................................. 2-2
- ORG.......................................................................... 8-103
- Output of the Work Home Position Signal ......................... 8-63
- Overrun ....................................................................... 8-114
- OVERRUN&S-SENSOR .................................................. 7-3

### P

- PALY EDIT JOB LIST ...................................................... 7-2
- PARAMETER ............................................................... 7-4
- Path Confirmation ........................................................ 13-4
- PINION DIAMETER ....................................................... 12-19, 12-31
- PLAYBACK COND. ......................................................... 7-4
- PM ............................................................................. 7-4
- POSITION (BASE) ......................................................... 7-2
- POSITION (ROBOT) ....................................................... 7-2
- POSITION (ST) .............................................................. 7-2
- Positioning System ....................................................... 13-3
- Power ON Unit ............................................................ 14-4
- POWER ON/OFF POS ................................................ 7-3
- Power Supply ................................................................ 4-3, 13-3
- Preventive maintenance for the hard ware ......................... 8-203
- Preventive maintenance function ...................................... 8-175
- Primary Power Supply Breaker Installation ...................... 4-6
- Procedure after the alarm .............................................. 8-18
- Program Control Instructions ......................................... 13-5
- Programming ............................................................... 13-5
- Programming Pendant .................................................. 13-5
- pulse output allocation .................................................. 8-128, 8-136

### R

- R-Axis ....................................................................... 6-3
