MotoEye™ SF
SYSTEM MANUAL
For DX100, DX200, and YRC1000 Controller

Upon receipt of the product and prior to initial operation, read these instructions thoroughly, and retain for future reference.

YASKAWA INSTRUCTIONS
DX100, DX200, OR YRC1000 INSTRUCTIONS
DX100, DX200, OR YRC1000 OPERATOR'S MANUAL
DX100, DX200, OR YRC1000 MAINTENANCE MANUAL

Part Number: 161204-1CD
Revision: 7
For Your Safety

Robots generally have requirements which are different from other manufacturing equipment, such as larger working areas, high-speed operation, rapid arm movements, etc., which can pose safety hazards. Read and understand the instruction manuals and related documents, and observe all precautions in order to avoid the risk of injury to personnel and damage to equipment.

Carelessness contributes to serious accidents in the work area.

It is the user’s responsibility to ensure that all local, state, and national codes, regulations, rules, or laws relating to safety and safe operating conditions are met and followed.

**DANGER**

- Teaching, operations, and maintenance of the Robot must conform to:
  - Industrial Safety and Health Law
  - Order for Enforcement of the Industrial Safety and Health Law
  - Industrial Safety and Health Regulations
  - Technical Standards for Electrical Facilities

Other related laws and regulations are:
- Occupational Safety and Health Act in USA
- Factory Act (Gewerbeordnung) in Germany
- Health and Safety at Work, etc. Act in UK
- EC Machinery Directive 2006/42/EC

- Prepare:
  - SAFETY WORK REGULATIONS based on concrete policies for safety management complying with related laws and regulations.

- Observe:
  - JIS B 8433-1: 2015 “Robots for industrial environments-Safety requirements” (ISO 10218-1: 2011) for safe operation of the robot. (JIS B 8433 is for Japan only)

- Reinforce:
  - SAFETY MANAGEMENT SYSTEM by designating authorized operators and safety managers for the Robot, as well as giving continuing safety education and training.

- Teaching, operation, and maintenance of the Robot are specified as “Hazardous Operations” in the Industrial Safety and Health Act (for Japan only). Personnel engaged in these operations must receive special training offered by YASKAWA.
We suggest that you obtain and review a copy of the ANSI/RIA National Safety Standard for Industrial Robots and Robot Systems (ANSI/RIA R15.06-2012). You can obtain this document from the Robotic Industries Association (RIA) at the following address:

Robotic Industries Association
900 Victors Way
P.O. Box 3724
Ann Arbor, Michigan 48106
TEL: (734) 994-6088
FAX: (734) 994-3338
www.roboticsonline.com

Ultimately, well-trained personnel are the best safeguard against accidents and damage that can result from improper operation of the equipment. The customer is responsible for providing adequately trained personnel to operate, program, and maintain the equipment.

We recommend approved YASKAWA training courses for all personnel involved with the operation, programming, or repair of the equipment.

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications.
**WARNING**

- Safe operation of this equipment is the user's responsibility.
  - The conditions under which the equipment will be operated safely should be reviewed by the user. The user must be aware of the various national codes, ANSI/RIA R15.06-2012 safety standards, and other local codes that may pertain to the installation and use of this equipment.

Not following all national codes, safety standards, and local codes can result in death or serious injury.

- Additional safety measures for personnel and equipment may be required depending on system installation, operation, and/or location.
  - The following safety equipment is provided as standard:
    - Safety barriers
    - Door interlocks
    - EMERGENCY STOP button

Not providing additional safety measures as required can result in death or serious injury.

- Check all safety equipment frequently for proper operation.
  - Repair or replace any non-functioning safety equipment immediately.

If safety equipment does not operate properly, death or serious injury can result.

---

**CAUTION**

- Only trained personnel familiar with the operation, manuals, electrical design, and interconnections of this equipment should program, or maintain the system.

Any personnel involved with the operation of the equipment must understand potential dangers of operation.

---

**NOTICE**

- The drawings and photos in this manual are examples. Differences may exist between them and the delivered product.

- YASKAWA may modify this model without notice due to product improvements, modifications, or changes in specifications. If such modification is made, the manual number will also be revised.

- Some operations require standard passwords and while others require special passwords.

- If a manual is damaged or lost, contact Customer Support to order a new copy. Make sure to tell Customer Support the Part Number listed on the front cover.
Notes for Safe Operation

Read this manual carefully before installing, operating, maintaining, or inspecting the system.

In this instruction, Safe Operations are classified as “DANGER”, “WARNING”, “CAUTION” or “NOTICE”.

**DANGER**
Indicates an imminently hazardous situation which, if not avoided, **WILL** result in death or serious injury.

**WARNING**
Indicates a potentially hazardous situation which, if not avoided, **MAY** result in death or serious injury.

**CAUTION**
Indicates a hazardous situation, which if not avoided, **MAY result in minor to moderate injury**.

**CAUTION**
Indicate a situation which if not avoided **may result in equipment damage**.

**NOTICE**
Indicates practices not related to personal injury.

**NOTICE**
To ensure safe and efficient operation at all times, be sure to follow all instructions, even if not designated as “DANGER”, “WARNING” or “CAUTION”.

Installation and Wiring Safety

Review the Manipulator and Controller Instructions for details on installation and wiring.

In planning installation, adapt an easy to observe arrangement to ensure safety. Take safety into consideration when planning the installation. Observe the following when installing the Robot:

**DANGER**

- Maintenance and inspection must be performed by specified personnel.
  Failure to observe this caution may result in electric shock or injury.
- For disassembly or repair, contact Customer Support.
- Do not remove the motor, and do not release the brake.
  Failure to observe these safety precautions may result in death or serious injury from unexpected motion of the Robot's arm.
- Any person who programs, teaches, operates, maintains or repairs the included system MUST be trained and demonstrates competence to safely perform assigned tasks.
  Failure to observe these safety precautions may result in death or serious injury from unexpected movements.

**WARNING**

- Run the piping, wiring, and cables for the Controller, Robot, Positioner control panel, peripheral devices, etc. in a pit so that are not stepped on by personnel or run over by a forklift.

Failure to observe this Warning may cause personnel to trip over exposed piping, wiring, or a cables, which may result in personal injury. Additionally it may also cause damage to piping, wiring, or cables, and unexpected movement of the Robot, which may result in personal injury and/or equipment damage.
CAUTION

• Make sure all covers and shields are installed correctly before operating.
  – Some drawings in this manual may have protective covers or shields removed to show details.

Not having all covers and shields installed correctly can result in injury.

• When installing the Robot system, avoid interference with buildings, structures, utilities, other machines.

Not avoiding these items may create trapping or pinch points.

• Do not make unauthorized modifications.

Unauthorized modifications can result in injury or equipment damage and will void the warranty.

• Inspect:
  – For problems with movement
  – Damages to external wires

Repair any problems immediately and perform all necessary procedures. If problems are not repaired or procedures are not fixed unexpected results can occur causing injury.

NOTICE

• If supplying a supplementary audible means for Robot operation, it shall exceed the ambient noise at the end-use of the application.

• Any changes or additions to the applicable information as provided by the manufacturer is to be provided by the party that makes the change or addition to the Robot system
Ensure Safety

**DANGER**

- When the power supplies of the Robot are turned ON at start-up, be sure to confirm the following:
  - Safety protection devices such as the E-STOP circuit, door interlocks, etc. operate normally.
  - Each axis operates normally in TEACH mode.
  - Robot operates normally at the speed limit or less in the TEACH mode. (Speed limit: 250 mm/s at the TCP or the flange)
  - The teaching function and the playback function operate normally.

- The Robot may stop movements while waiting for a condition to be satisfied during operation.
  Once meeting the condition, the Robot starts movement causing a danger that will cause death or severe injury.

- Make sure to clearly indicate when the Robot is in operation:
  - Use a pilot lamp and/or an audible alert or
  - The Robot stops operation if the operator comes close.

- Install a safety fence around the Robot to prevent any accidental contact with the Robot when power is applied.
  - Display a warning sign stating “Off-Limits During Operation” at the entrance of the safety fence.
  - The gate of the safety fence must be equipped with a safety interlock to turn the servo power OFF when the gate opens.
  - Make sure interlocks operate properly before use.

- For areas not enclosed by safety fences, use a photoelectric sensor, a safety light curtain, etc. to make sure that the Robot stops its operation if the operator enters its operating range.

Failure to observe this DANGER will result in death or serious injury due to contact with the Robot.
All personnel working with the Robot (safety administration, installation, operation, and maintenance personnel) must always be prepared and "Safety First" minded, to ensure the safety of all personnel.

**WARNING**

- In the vicinity of the area where the Robot is installed, avoid any dangerous actions, such as entering the Robot's operating range without due care.

Failure to observe this instruction may cause contact with the Robot or peripheral equipment, which may result in death or serious injury.

- Strictly observe the safety precautions and signs in the factory, such as “Flammable”, “High Voltage”, “Danger”, “Off-limits to Unauthorized Personnel”.

Failure to observe this instruction may result in death or serious injury due to fire, electric shock, caused by contact with the Robot or other equipment.

- Strictly observe the following precautions about clothing:
  - Always wear approved work clothes (no loose-fitting clothes).
  - To prevent mis-operation, do not wear gloves when operating the Robot.
  - Do not allow underwear, shirts, or neckties hang out from the work clothes.
  - Do not wear accessories, such as earrings, rings, or necklaces.
  - Always wear protective safety equipment, such as hard hats, safety shoes (with slip-proof soles), face shields, safety glasses, and gloves as necessary.

Failure to observe this instruction may result in death or serious injury.

- The following must be understood and strictly observed by all personnel as rules:
  - Unauthorized personnel other than the operator must not approach the area where the Robot is installed.

Failure to observe this instruction may cause contact with the Robot, Controller, control panel, workpiece, or Positioner, etc., may result in death or serious injury.
WARNING

• Turn OFF servo power before operating.
  – Press the EMERGENCY STOP button to turn off SERVO POWER. When servo power is OFF, the SERVO ON LED on the Programming Pendant is OFF.

If the EMERGENCY STOP button(s) do not work correctly, death or serious injury may result. Do not use if the EMERGENCY STOP button does not perform correctly.

*Fig. : EMERGENCY STOP Button*

• Clear the cell of all items which could interfere with the operation before releasing the EMERGENCY STOP button.

Death or serious injury may result from unintentional or unexpected motion.

*Fig. : Release of EMERGENCY STOP Button*

• Make sure no person is in the operating range and the operator is in a safe location before:
  – Turning ON power to the Controller
  – Moving the Robot with the Programming Pendant
  – Running the system in the TEACH mode
  – Performing automatic operations

Death or serious injury may result if a person enters the operating range during operation. Immediately press an EMERGENCY STOP button whenever there is a problem.
CAUTION

• All operators, programmers, maintenance personnel, supervisors, and anyone working near the system must be familiar with the operation of this equipment.
  – All personnel involved with the operation of the equipment must understand potential dangers of operation.

• General safeguarding tips:
  – Place system in E-STOP mode whenever it is not in use.
  – Use lockout/tagout procedures during equipment maintenance in accordance with ANSI/RIA R15.06-2012, section 4.2.5, Sources of Energy. Refer also to Section 1910.147 (29CFR, Part 1910), Occupational Safety and Health Standards for General Industry (OSHA).
  – Only trained personnel familiar with the operation of this equipment, the operator's manuals, the system equipment, and options and accessories can operate equipment.

Improper operation can result in personal injury and/or damage to the equipment.

• If the light in the operator’s working space is not bright enough, provide the space with appropriate lighting.

CAUTION

• Store industrial tools, etc. in a safe location outside the Robot's operating range.

If an industrial tool, etc. is left unattended on the Robot, on a fixture, or on the floor, etc., the Robot may come in contact with the industrial tool left unattended, which may result in damage to the Robot and/or the fixture.
Operation Safety

DANGER

• Personnel engaged in teaching or inspection, etc. of the Robot must receive special training required by applicable laws and regulations.

• While performing inspection and maintenance, wiring, or attaching a tool to the Robot, etc., make sure to turn OFF the power supply of the Robot Controller and the tool, and keep the switch of the power supply locked so that unauthorized personnel cannot turn ON the power supply.
In addition, display a warning sign stating “Energizing Prohibited”.

Turning ON the power supply without due care during inspection and maintenance, etc., may cause electric shock or unexpected movement of the Robot, which may result in personal injury.

• Use the Robot only within the specifications described in the manuals for the Robot.
Failure to observe this instruction may result in personal injury and/or equipment damage.

• Observe the following precautions when performing a teaching operation within the Robot's operating range:
  – Be sure to perform lockout by putting a lockout device on the safety fence when going into the area enclosed by the safety fence. In addition, the operator of the teaching operation must display the sign that the operation is being performed so that no other person closes the safety fence.
  – View the Robot from the front whenever possible.
  – Always follow the predetermined operating procedure.
  – Always keep in mind emergency response measures against the Robot's unexpected movement toward a person.
  – Ensure a safe place to retreat in case of emergency.
Failure to observe this instruction may cause improper or unintended movement of the Robot, which may result in personal injury.
DANGER

• Before operating the Robot, make sure the servo power is turned OFF by performing the following operations. When the servo power is turned OFF, the SERVO ON LED on the Programming Pendant is turned OFF.
  – Press the EMERGENCY STOP buttons on the front door of the Robot Controller, on the Programming Pendant, on the external control device, etc.
  – Disconnect the safety plug of the safety fence. (when in the PLAY mode or REMOTE mode)

If operation of the Robot cannot be stopped in an emergency, personal injury and/or equipment damage may result.

• Make sure that all safety protection devices are activated before starting a job in the PLAY mode.

• Confirm that no person is present in the Robot's operating range and that the operator is in a safe location before:
  – Turning ON the Robot Controller
  – Moving the Robot by using the Programming Pendant
  – Running the system in the TEACH mode
  – Performing automatic operations

Personal injury may result if a person enters the Robot's operating range during operation

• Immediately press an EMERGENCY STOP button whenever there is a problem.
WARNING

• Read “Safety” of the Robot Controller instructions before operating. Not reading and understanding chapter 1 of the Robot Controller instruction can result in death or serious injury.

• Read and understand all Warning Labels before operating. Not reading and understanding all Warning Labels can result in death or serious injury.

• Confirm that no person is present in the P-point maximum envelope of the Robot before:
  – Turning on the power for the Robot Controller.
  – Moving the Robot with the Programming Pendant.
  – Running the system in the TEACH mode.
  – Performing automatic operations.

Injury may result if anyone enters the working envelope of the Robot during operation. Always press an EMERGENCY STOP button immediately if there are problems.

• Observe the following when performing teaching operation within the operating range:
  – Lockout by putting a lockout device on the safety fence when going into the area enclosed by the safety fence.
  – Display a sign that operations are being performed so no other person closes the safety fence.
  – View from the front whenever possible.
  – Always follow the predetermined operating procedure.
  – Always keep in mind emergency response measures against unexpected movement toward a person.
  – Ensure a safe place to retreat in case of emergency.

Failure to observe this precautions may cause improper or unintended movement, which may result in personal injury.

• Maintenance and inspection must be performed by specified personnel.

Failure to observe this Warning may result in electric shock or injury.

• Contact Customer Support for disassembly or repairs.

Not contacting Customer Support can result in electrical shock or injury.
Safety

CAUTION

Robot Cells have Collaborative Motion functionality:
Collaboration is a special type of operation between a person and Robot sharing a common workspace. The following are the guidelines for collaborative operation.
1. Used for pre-determined tasks.
2. Possible when all protective measures are active.
3. For Robots with features specifically designed for collaborative operation.

The integrator shall include in the information for use the safeguards and mode selection required for collaborative operation.

CAUTION

- Do not operate the Robot when a [COOLING FAN2 ERROR] appears on the Programming Pendant.
If operation continues with a warning message, equipment damage can occur.
- During high speed continuous operation Robot temperature may rise quickly depending on ambient temperature and operation pattern.
If a warning message displays stop operations or equipment damage may occur.
- Monitor warning messages on the Programming Pendant.
Not monitoring warning messages may cause equipment damage.
- Refer to the Controller Concurrent I/O manual for details on the signal output.
Not referring to Controller Concurrent I/O manual can result in equipment damage.
**Maintenance Safety**

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
</table>
| • Make sure equipment has no potentially hazardous conditions.  
  – area is clean and free of water, oil, debris, etc.  
  – all safeguards are in place.  
  – all safety equipment work correctly. Repair or replace any non-functioning safety equipment immediately.  
  – Check the EMERGENCY STOP button(s) for proper operation before programming. The equipment must be in E-STOP mode when not in use. |

If a hazardous condition is present death or serious injury may occur.

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
</table>
| • Use care when modifying software.  
  – The equipment allows modifications to the software for maximum performance. |

All modifications made to the software will change the way the equipment operates and may cause death or serious injury, as well as damage parts of the system.

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• Make sure all modifications did not make create a hazardous or dangerous condition in all modes.</td>
</tr>
</tbody>
</table>

All modifications made to the software will change the way the equipment operates and may cause death or serious injury, as well as damage parts of the system.

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• Disconnect and lockout/tagout all sources of energy before making modifications or connections.</td>
</tr>
</tbody>
</table>

Not disconnecting and doing lockout/tagout of all sources of energy can result in death or serious injury.

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• Read and understand all maintenance procedures before completing procedures.</td>
</tr>
</tbody>
</table>

Not reading and understanding maintenance procedure may result in death or serious injury.
CAUTION

• Do not modify the Robot Controller.
   Making modifications without written permission from YASKAWA will void the warranty.

• Back up all programs and jobs onto suitable media before program changes are made.
   To avoid loss of information, programs, or jobs, a backup must always be made before any service procedures are done and before any changes are made to options, accessories, or equipment.

• Use proper replacement parts only.
   Not using proper replacement parts can cause damage to equipment.

• All connections must be made within the standard voltage and current ratings of the equipment.
   Improper connections can damage the equipment.

Notes for Moving and Transferring the Robot

DANGER

• When relocating, transferring, or selling the Robot, make sure that the Robot is always accompanied by its manuals so that all users have access to necessary manuals.

   See the Bill of Material for a list of the manuals.

   If any of them is missing, contact Customer Support. The telephone numbers of our offices are listed on the back cover of this manual.

   If a warning label on the Manipulator or the Controller is dirty and unreadable, clean the label to make it clearly readable. If a warning label has come off, put the label back in place. Note that some local laws and regulations may prohibit equipment operation if safety labels are not in place.

   Contact Customer Support if requiring new warning labels.

• After the Robot is relocated, inspection by Customer Support is recommended.

   If installation or wiring of a device is incorrect, personal injury and/or equipment damage may result.
Definition of Terms Used Often in This Manual

The Robot is the YASKAWA industrial robot product.

The Robot usually consists of a Manipulator, Robot Controller, Programming Pendant, and Robot cables.

In this manual, the equipment is designated as follows:

<table>
<thead>
<tr>
<th>Equipment</th>
<th>Manual Designation</th>
</tr>
</thead>
<tbody>
<tr>
<td>DX200/DX100/YRC1000 controller</td>
<td>Robot Controller</td>
</tr>
<tr>
<td>DX200/DX100/YRC1000 Programming Pendant</td>
<td>Programming Pendant</td>
</tr>
<tr>
<td>Manipulator</td>
<td>Manipulator</td>
</tr>
<tr>
<td>Cable between the Robot and the Controller</td>
<td>Robot cable</td>
</tr>
<tr>
<td>Positioner</td>
<td>Positioner</td>
</tr>
<tr>
<td>Controller, Programming Pendant, Manipulator</td>
<td>Robot</td>
</tr>
</tbody>
</table>

Descriptions of the Programming Pendant keys, buttons, and displays are shown as follows:

<table>
<thead>
<tr>
<th>Equipment</th>
<th>Manual Designation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Programming Pendant</td>
<td>Character Keys /Symbol Keys</td>
</tr>
<tr>
<td></td>
<td>Axis Keys /Numeric Keys</td>

<td>Displays</td>
</tr>
</tbody>
</table>
Registered Trademark

In this manual, names of companies, corporations, or products are trademarks, registered trademarks, or bland names for each company or corporation. The indications of ® and ™ are omitted.
Robot Disposal

WARNING

• Take precautionary measures to prevent the Robot from overturning, such as anchoring it firmly, etc., even when temporarily storing it before disposal.

Failure to observe this instruction may cause overturning of the Robot, which may result in personal injury.

CAUTION

• Do not modify the Robot

Failure to observe this instruction can cause fire, mechanical failure, or malfunction, which may result in personal injury and/or equipment damage.

NOTICE

• When disposing of or recycling the Robot, follow the applicable national/local laws and regulations.

• This symbol is applicable in some locations.

The wheelie bin symbol on this product, manual or its packaging indicates that at the end of life the product should enter the recycling system. It must be disposed at an appropriate collection point for electrical and electronic equipment (EEE) and should not be put in the normal waste stream.

1 Introduction

1.1 About This Document

This manual is intended for personnel who has received operator training from YASKAWA and who are familiar with the operation of this particular YASKAWA system. For more detailed information on any specific component or peripheral of the YASKAWA MotoEye SF system, please review the full documentation package that is included with the YASKAWA MotoEye SF system (refer to section 1.4).

1.2 System Overview

The YASKAWA MotoEye™ SF (Seam Finder) function for the Robot Controller provides a solution for finding the weld seam using an Ethernet communication interface with a Servo-Robot seam-finding sensor.

1.3 Major Components

The MotoEye SF system includes the following major components:

- One Servo-Robot Laser Seam-Finding sensor
- PC software for setup of the laser sensor
1.4 Reference Documentation

For additional information on individual components of the MotoEye SF system, refer to the following documentation:

1.4.1 General Documentation

- YASKAWA Motoman Operator's Manual for General (P/N 155507-1CD)
- Vendor manuals for system components not manufactured by YASKAWA

1.4.2 DX100 Robot Controller Documentation

- YASKAWA Motoman DX100 Controller Manual (P/N 155494-1CD)
- YASKAWA Motoman DX100 Maintenance Manual (P/N 155492-1CD)
- YASKAWA Motoman DX100 Macro Command Function Manual (P/N 156439-1CD)
- YASKAWA Motoman DX100 Concurrent I/O Manual (P/N 155491-1CD)
- YASKAWA Motoman DX100 MH-Series Positioner Manual (P/N 156488-1CD)
- YASKAWA Motoman DX100 Independent/Coordinated Control (P/N 156431-1CD)
- YASKAWA Motoman DX100 INFORM User’s Manual (P/N 155493-1CD)

1.4.3 DX200 Robot Controller Documentation

- YASKAWA Motoman DX200 Installation and Operations Manual (P/N 165292-1CD)
- YASKAWA Motoman DX200 Maintenance Manual (P/N 165293-1CD)
- YASKAWA Motoman DX200 Macro Command Function Manual (P/N 166242-1CD)
- YASKAWA Motoman DX200 Concurrent I/O Manual (P/N 165294-1CD)
- YASKAWA Motoman DX200 MH185, MH555, and MH1655 Positioner Manual (P/N 168961-1CD)
- YASKAWA Motoman DX200 Independent/Coordinated Control (P/N 165836-1CD)
- YASKAWA Motoman DX200 INFORM User’s Manual (P/N 165301-1CD)
1.4.4 YRC1000 Robot Controller Documentation

- YRC1000 READ FIRST!! (179526-1CD)
- YRC1000 Controller Instructions (178642-1CD)
- YRC1000 General Operator’s Manual (P/N 178645-1CD)
- YRC1000 Maintenance Manual (P/N 178643-1CD)
- YRC1000 Alarm Codes Manual (P/N 178644-1CD)
- YRC1000 Concurrent I/O Manual (P/N 178648-1CD)
- YRC1000 Macro Command Function Manual (178673-1CD)
- YRC1000 Independent/Coordinated Control Function Manual (178660-1CD)
- YRC1000 Inform Language Manual (178649-1CD)
- YASKAWA Motoman MH185, MH555, and MH1655 Positioner Manual (P/N 168961-1CD)
1.5 Customer Support Information

If you need assistance with any aspect of the MotoEye SF system, contact Customer Support at the following 24-hour telephone number:

(937) 847-3200

For routine technical inquiries, Customer Support can also be contacted at the following e-mail address:

techsupport@motoman.com

When using e-mail to contact Customer Support, provide a detailed description of your issue, along with complete contact information. Allow approximately 24 to 36 hours for a response to your inquiry.

NOTICE

Use e-mail for routine inquiries only. If there is an urgent or emergency need for service, replacement parts, or information, contact Customer Support using the 24-hour telephone number.

Please have the following information ready before you call:

- System
  MotoEye SF including name/model of laser sensor
- Manipulator
- Positioner
- Primary Application
  Welding
- Robot Controller
  DX100 or DX200 or YRC1000
- Software Version

2 Equipment Description

2.1 Servo-Robot Seam Finding Sensor

The Servo-Robot laser sensor is used to measure two dimensions (i.e., lateral and vertical) of movement in a weld seam.

A laser-sensor projects a laser line perpendicular to the weld seam and through a CCD (charge-couple device) camera captures a reflected image of the laser line. The image that is reflected is then processed by the laser sensor by comparing the actual joint to a predetermined joint profile. Software in the camera then determines a tracking point (i.e., the profile of a 2.5 mm lap joint). This tracking point is intended to be attached to a particular user-defined feature of the joint profile (i.e., between the upper corners of a v-groove weld joint). The laser sensor’s field/depth of view will track the weld joint if it should fluctuate and the tracking point will adjust accordingly by the Servo Robot software.

Fig. 2-1: Servo-Robot Seam Finder Sensors
2.2 Equipment Description

2.2 Laser Power and Control:

2.2.1 Laser Power:

Power for the SF laser camera is provided by the Robot Controller. Laser safety standards dictate that a key-switch must be supplied and implemented as a means of preventing inadvertent power-up of the laser while within the robotic work cell.

These key-switches control power to the camera and provide a means of preventing inadvertent operation while in the work cell. See Fig. 2-2 “Laser Switches”

- While regular in-cell maintenance is taking place, turn the key-switch to the [OFF] position and remove the key.
- While teaching or production, ensure the key-switch is in the [ON] position enabling power to the camera.

2.2.2 Laser Control:

The laser line can be “muted” and “unmuted” either using the WeldCom PC software or directly from the robot’s teach pendant. To enable/disable the laser line from the teach pendant while in [TEACH] mode, press the following:

- Laser#1: [INTERLOCK] + [1]
- Laser#2: [INTERLOCK] + [2]
- Laser#3: [INTERLOCK] + [3]
- Laser#4: [INTERLOCK] + [4]

**NOTICE**

Pressing the above sequence of buttons toggles the laser line from one state to another (muted-to-unmuted and unmuted-to-muted).
2.3 Robot Interface

In order to calculate a shift offset, the robot needs a nominal location to base future measurements off of. The nominal location is saved during the teaching procedure. The robot compares the nominal locations of Y and Z to the measured position to create this offset. For instance, if the robot is programmed with a nominal Z position value of 100 mm and a measured value of 106 mm is sent from the sensor to the robot, the robot develops a +6mm shift offset. (106-100=6).

The nominal positions are controlled in the L*-SF macro job by two values: a Y and Z setting. These nominal values define a specific location within the laser sensor’s field of view. These two values are defined in the SETUP section of the L*-SF macro job and are global settings (This same location is referenced every time the L*-SF macro instruction is used). See Fig. 3-7: L*-SF Macro on page 3-3 to see the SETUP instructions.

The nominal positions are typically set in the middle of the Field of View/Field of Depth but can be placed almost anywhere in the Field of View/Field of Depth to suit application needs. The typical location of the Nominal Z Position is shown in Fig. 2-3(a “Nominal Z Position using MotoEye SF V200/V350”.

**NOTICE**

- In current versions of MotoEyeSF (v2.4.0 and up), the Nominal Z Position is controlled by local variable LR003 in the L*-SF macro job.
- In prior versions of MotoEyeSF (v2.3.0 and older), the Nominal Z Position is controlled by LD013
Fig. 2-3(a): Nominal Z Position using MotoEye SF V200/V350
Fig. 2-3(b): Nominal Z Position using MotoEye SF i-CUBE 100L

Fig. 2-3(c): Nominal Z Position using MotoEye SF i-CUBE 350L
The location of the Nominal Y and Z Positions can be adjusted (in the event the application requires it) from within the L*-SF macro job. Adjusting the value of the R003 (Nominal Z Position) parameter to a larger value will move the laser sensor closer to the weld seam. See Fig. 2-4 “Setting Nominal Z Position too High” for an example that could cause the robot to crash.

Fig. 2-4: Setting Nominal Z Position too High

For each instance that the L*-SF macro instruction is executed in the job, the robot should be initially (ie. during initial teaching) moved to a location over the weld seam such that if a measurement is made, the nominal locations are measured by the sensor. A convenient feature of the Auto Teach mode of the L*-SF macro instruction is that it discovers this location for the user, and the user is asked to Re-Modify the Reference Position, which saves the desired location to the L*-SF macro job.

CAUTION

- Use care when increasing parameters.
Not using care when increasing the parameter can cause the robot to crash.
After the robot is programmed to each desired detection position for the application (so that the nominal locations are measured by the sensor), the user then programs the weld path(s). If everything was programmed correctly, the (original taught part/"master" part) execution of the various L*-SF macro instructions should produce close to zero shift amounts and the weld path points (because they were programmed to the original part and are getting close to zero shift amounts) should be in the weld joints.

The laser sensor is used to detect and adapt to weld joints that are not located in the same location every time (relative to the robot). Placing new, varying parts into the robot system should produce non-zero shift amounts (this can be observed by monitoring the destination P variable after successful execution of the L*-SF macro instruction). These shift amounts should be shifting the weld points from the original programmed location and into the deviated weld seams.

An example of how the robot calculates the shift offset, by comparing the detected seam location to the nominal positions are shown in Fig. 2-5 "Shift Offset".

*Fig. 2-5: Shift Offset*
After processing of the weld joint profile is completed, the measured data is available for the robot. The Robot Controller receives the data from the laser sensor and calculates a shift amount for the point(s) on the weld path.

The Robot Controller calculates the shift amount by using the Y and Z values from the camera and converts them to X, Y, and Z values for the robot.

In order for the measurements to be converted, proper tool files need to be set up (L1-SF uses tool # 60, L2 - tool # 61, L3 - tool # 62, L4 - Tool # 63).

After the measured data is successfully translated into a robot coordinate system, the data is available to the robot job through the use of the {SFTON} instruction (Shift On function).

If needing to weave when welding, use the gap measurement with the {WVADJ} (Weave Adjust) inform command to allow for continuous varying adaptive process control. This will change the weave amplitude and travel speed gradually between two programmed robot positions based on changes in the gap measurements.

NOTICE

The SF*-ADV macro is intended only for applications which require advanced control. This macro does not perform position calculations on the sensor data. Therefore, it should not be used for normal functionality, as described above.
Always comply with all the safety instructions and precautions given throughout this manual during the installation process.

The instructions given in this section are general guidelines for installing the MotoEye SF system. Refer to the system drawings and relevant system component manuals for specific installation information.

## 3.1 System Requirements

Most system components and most hardware items required for installation of the MotoEye SF system to a Robot Controller are included. Additional cables will need to be purchased through YASKAWA or Servo Robot directly.

## 3.2 Servo-Robot Software Setup

The current Servo-Robot software platform called “Weldcom” resides on a PC and accesses the vision system for parameter setup, tuning, etc.

1. Load the included Weldcom Software onto a PC.

2. Connect an Ethernet cable from the Servo-Robot interface module to the Ethernet port on the PC.

3. Configure the PC network connection to an IP address that will work with the Servo-Robot SF sensor.

### NOTICE

- The IP address of the SF sensor can be changed from Microsoft Internet Explorer browser. See Servo-Robot documentation for full instructions.
- Some sensors will require that Internet Explorer use “Compatibility View”.
- The IP address of the PC must not be identical to the SF sensor.
- It is recommended to set the Subnet Mask to “255.255.255.0”. If this mask is used, then the first three groups of the IP addresses must match. Example: 192.168.1.xxx
3 Installation

3.2 Servo-Robot Software Setup

- The IP address of the SF sensor is displayed on the LED panel when the sensor is powered up. If the following is seen “IP … 192 … 168 … 1 … 71 …” this means that the sensor’s IP address is 192.168.1.71.

- It is recommended to use an IP address for the PC of 192.168.1.5 or higher

**NOTICE**

The IP range 10.0.0.xxx is reserved on the system and may not be used by the PC or SF sensor.

4. On the PC, manually set the IP (Network Settings >> Local Area Connection > Properties > Internet Protocol Version 4 (TCP/IPv4) >Properties. Use the IP address that user has just created.

5. Start the WeldCom program.

*Fig. 3-1: WeldCom Program Screen*

6. Click on “Link to a new server” and enter the IP address observed during power up of the Servo-Robot sensor.

7. Enter the required port number and click the blue Check button.

**NOTICE**

Typically the port number is “10001”. See the included Servo-Robot documentation “Quick Setup Guide” if this port number does not work.
3.2 Servo-Robot Software Setup

8. The main “Vision” screen appears.

*Fig. 3-2: Vision Screen*

9. Click on the Pencil icon to open the editing menu on the right side of the Vision screen.

### 3.2.1 Create or Edit a Task

The instructions below will allow the user to create or edit a task.

Start from the Vision screen when needing to create or edit a task.

1. Press the “+” key located in the PART sub section if no part has been created yet.
2. Press the “+” key located in the TASK sub section.
3. Select a task number and name. Specify if a new blank task if desired or copying data from an existing task and modifying existing parameters.

*Fig. 3-3: Task Screen*
3.2 Servo-Robot Software Setup

4. If editing an existing task parameter click on the “thinking man” icon in the TASK BAR.

5. Select the Recognition Algorithm to use.
   - Select the type of weld joint that is desired to be found.

   ![CAUTION]
   
   It is important to have a stable, consistent tracking point (the red “X” on the screen) when the robot is not moving when adjusting the parameters. The tracking point will be the center of the weld joint.

6. Adjust the required parameters. (Proper training from Servo Robot is highly recommended.) See Servo Robot documentation if unsure how to adjust parameters.

7. Complete one of the following:
   - Press the blue Check button to save data.
   - Press the blue Return button to undo recent changes.
   - Press the blue Exit button to leave screen without saving additional changes.
3.3 Robot Controller Interface

The L1-SF-INSPECT, L2-SF-INSPECT, etc macro jobs generate bi-directional communication with the Servo-Robot sensor. The macro job enables the laser emission, selects a profile #, and then populates the specified P variable with the measured shift offsets. The P variables are then used in the job with the {SFTON} instruction. See Figure 3-4: "Robot Controller Interface Flowchart".

1. The Robot Controller must have a number of functions enabled by Customer Support prior to use.
2. Load the L*-SF, SF*-ADV, SF*-RST, and MACRO.DAT files into the Robot Controller.
   a) One laser system: L1-SF.
   b) Two laser system: L1-SF (laser #1 for R1), L2-SF (laser #2).
   c) Three laser system: L1-SF, L2-SF, and L3-SF.
   d) Four laser system: L1-SF, L2-SF, L3-SF, and L4-SF.
3. Open the L*-SF macro(s) and cursor to the "----------SETUP----------" section. This is used to configure the macro for your specific application.

NOTICE

Robot string (S) variables are used to notify the Robot Controller about the IP address of the sensor.

NOTICE

- When adjusting the nominal Y and Z distances, this will affect position of the sensor relative to the part.
- If the nominal positions of the laser sensor are set too close to the face of the laser sensor, the torch may contact the surface of the part.
- The larger the value of the nominal Z distance parameter, the closer the laser sensor will be to the surface of the part!

4. The setup section of the macro contains instructions for each of the following items which must be configured:
   - Model of laser sensor.
   - Nominal Z distance for vertical standoff.
   - Nominal Y distance for lateral offset.
   - Output signal for shutter door.
   - Robot tool file for the sensor calibration data.
   - Error handling and retry attempts.
MotoEye SF

3 Installation
3.3 Robot Controller Interface

- Additional data to retrieve from the sensor.

**NOTICE**

- Once beginning to program the application, do not change the values in the Setup Section
- Reteach the nominal positions if the weld points are relocated.
- No setup modifications are required for SF*-ADV. This macro is intended only for advanced functionality.
3.4 Setting Robot Data For The Seam-Finding Sensor

Inside the laser sensor, measurements are based on a 2D plane and needs to be converted to a 3D robot coordinate system to be useful to the robot. A specific Tool (for Laser 1, Tool 60 is used) coordinate system is used for this conversion.

3.4.1 Setting Tool Data with Calibration Macro

**CAUTION**

- Configure the TCP of the welding torch correctly

Not configuring the TCP of the welding torch correctly can cause a crash and/or poor calibration.

This calibration routine compares a number of laser measurements to the position of the robot's torch tip at a known location. Based on these comparisons, it is able to automatically detect the position and orientation of the SF sensor.

This routine will generate a new tool file (tool 60 for laser 1) that contains a TCP for the laser line. If desired, this tool can be used for jogging to make part programming easier.

Proper orientation of the laser's tool file is critical for operation of the Lx-SF-INSPECT macro job (Lx-SF).

3.4.1.1 Setup The Calibration Macro

1. Open the Lx_SF_CALIBRATE macro for editing.
2. Cursor down to the SETUP section of the macro.
3. Configure the height of where the tool TCP will be located in the laser's field of view.
   - Recommended heights for each sensor model are listed in the macro. Set variable LI000 to the desired height value.

**NOTICE**

Once setting the LI000, do not modify the calibration macro jobs. See below for the procedure to register the calibration instruction.

4. Continue with registering the calibration instructions.
3 Installation
3.4 Setting Robot Data For The Seam-Finding Sensor

Fig. 3-5: Setting the Desired Height

Fig. 3-6: Setting LI000 (Height) Screen
3.4.1.2 Programming the Calibration Macro

Calibration is performed by recording a series of reference positions at a known location. First, the welding torch is recorded at a specific location. Then a series of positions are recorded such that the laser's tracking point is always placed at the location of the original torch position.

It is recommended to use a workpiece with a basic lap joint. A point should be marked on the lap joint where the laser will detect a tracking point.

The tool to which the sensor is physically mounted must already have a properly configured TCP. See the Robot Controller instruction manual for information on configuring a TCP. For more details refer to section 1.4 “Reference Documentation” on page 1-2.

**NOTICE**

The calibration macro will only work properly if the sensor is physically mounted to an EOAT connected at the T flange of the robot arm.

3.4 Setting Robot Data For The Seam-Finding Sensor

3.4.1.3 Programming Reference Positions for Calibration

1. Using a basic lap joint, scribe a mark on the edge of the top plate.

2. Setup a Servo Robot task to detect the tracking point on the edge of the top plate.

3. For each argument in the macro detail-edit screen, cursor over the word UNREGIST and press [MODIFY] then [ENTER] to capture the position of the TCP.
   • The argument value should change to REGIST to indicate that the position has been successfully recorded.

4. Set the Tool Reference Position
   • The first point should be recorded with the TCP of the tool directly on the marked point in the joint.

*Fig. 3-8: Tool Reference Position*
3.4 Setting Robot Data For The Seam-Finding Sensor

5. Set the Sensor Reference Point 1

- Ensure the Servo Robot Weldcom software visible on the PC during this process.
- Unmute the sensor using the Weldcom software.
- Record the next point such that the Tracking Point of the joint profile is exactly where the Tool Reference Point was recorded in step 4.
- For the first reference position, the Tracking Point should be located near the center of the laser's field of view.

*Fig. 3-9(a): Setting the Sensor Reference Point 1*
6. Set Sensor Reference Position 2, 3, and 4

- Record the next point such that the Tracking Point of the joint profile is exactly where the Tool Reference Position was recorded for each sensor reference position.
  - For the **second reference position**, the Tracking Point should be located near the top-center of the laser's field of view.
  - For the **third reference position** the Tracking Point should be located near the bottom-left of the laser's field of view.
  - For the **fourth reference position** the Tracking Point should be located near the bottom-right of the laser's field of view.

*Fig. 3-9(b): Setting the Sensor Reference Points 2 through 4*
Installation

3.4 Setting Robot Data For The Seam-Finding Sensor

7. Program the Escape Reference Position
   • During the calibration routine, the robot will move to each of the recorded reference positions. Between each point, it will travel to the escape position. The escape position should be programmed such that the robot can move from this position to each of the other reference-positions without colliding into the workpiece or the table.

3.4.1.4 Executing the Calibration Macro

After recording all of the reference positions and setting the remainder of the macro arguments, you must execute this macro routine in a robot job. During execution, the robot will automatically enable the laser and move to each of the recorded positions.

When the macro is done executing, it will populate the position variable specified in the “Calib Error Amnt” argument. This will contain the calculated residual of the calibration routine. It can be used as a gauge of the calibration’s accuracy.

**NOTICE**

This routine automatically modifies your tool data. If the FSU is enabled on this system, you will need to reboot after performing the calibration routine. Upon reboot, you will get an alarm that indicates you need to perform a functional safety flash reset.

3.4.2 Setting Tool Orientation Manually

The following procedure provides the means for defining the correct orientation for the Tool used for the laser sensor.

**NOTICE**

Use the calibration macro (described above) for the most accurate tool setup.

1. Open the Tool file corresponding to the laser number (MAIN MENU > ROBOT > TOOL).
2. The X, Y, and Z values are irrelevant to the calibration for the laser sensor. However, the orientation of the tool frame is critical. Therefore, adjust the RX, RY, and RZ data fields until the following conditions have been obtained when jogging using Tool File.
3. Scribe a straight line on a non shiny surface to check the setup of the laser. Move the robot so the laser is on top of the line. See Fig. 3-10(a “Orientation of Sensor”, Fig. 3-10(b “Orientation of Sensor”, and Fig. 3-11 “Positioning Laser on Scribed Line”.)
3 Installation
3.4 Setting Robot Data For The Seam-Finding Sensor

Fig. 3-10(a): Orientation of Sensor

Fig. 3-10(b): Orientation of Sensor
3.4 Setting Robot Data For The Seam-Finding Sensor

Fig. 3-11: Positioning Laser on Scribed Line

4. Verify the tool orientation by jogging the robot with the laser ON. Select the correct Tool number: Tool 60 for Laser 1, Tool 61 for Laser 2, Tool 62 for Laser 3, and Tool 63 for Laser 4. While jogging the robot in the Y and Z direction in the tool/frame, the laser line should remain projected along the scribed line.

   a) While jogging the robot in the Y direction of the corresponding tool, the laser line should move in the direction of the scribed line and should stay projected on the scribed line.

   Assuming Fig. 3-11 “Positioning Laser on Scribed Line” as a start position for the laser line, when jogging robot in the Y direction, Fig. 3-12 “Tool Verify Y Direction” should occur.

Fig. 3-12: Tool Verify Y Direction
3 Installation
3.4 Setting Robot Data For The Seam-Finding Sensor

b) While jogging the robot in the Z direction of the corresponding tool, the laser line should grow shorter and longer and stay projected on the scribed line. Assuming Fig. 3-11 “Positioning Laser on Scribed Line” as a start position for the laser line, when jogging robot in the Z direction, Fig. 3-13 “Tool Verity Z Direction” should occur.

Fig. 3-13: Tool Verity Z Direction

5. Repeat step 2. if Y or Z (Tool Frame) jogging is incorrect in the tool frame coordinate.

NOTICE

- The default numbers are listed on the hardware drawings included with your system.
- If adjustments are needed there is a tolerance of ±1°.
When programming a new weld joint, the following sequence must be used.

1. Turn the key switch on the Robot Controller to the ON position.
2. Move the sensor into a position until the laser is roughly perpendicular over the weld joint.
3. Setup a vision system “task” or verify the task that will be used to process the weld joint is operating with a stable tracking point (the red X) using Servo-Robot's Weldcom PC software.
4. Insert the seam finding macro instruction (ie. L1-SF) into the robot job. The L*-SF macro instruction(s) can be found under [INFORM LIST] > {MACRO}.
5. Reference the vision system task number by setting the TASK# argument of the L*-SF macro instruction to the task number.
6. Program the remaining argument fields of the seam finding macro instruction.
   a) Status Msg Bvar#: defines the B variable number to have the status of the macro job set to. After execution of the macro job, the L*-SF macro sets a value to B variable Number (Status Msg Bvar#). The value of the B variable will describe if the macro job executed successfully or if an error condition occurred. See Appendix A: for details on Status Message values.
   b) Teach Mode: enables/disables the AutoTeach function; 0 = AutoTeach off, 1 = AutoTeach on.
   c) Shift Amnt Pvar#: defines the P variable number to have the calculated shift amount saved to. After successful execution of the L*-SF macro, the shift amount is saved to P Variable Number (Shift Amnt Pvar#). This P variable should then be used with the {SFTON} instruction to shift the programmed weld path.
   d) Max Shift Amount: before the calculated shift amount is stored into the requested P variable number, the shift amount is compared to the Max Shift Amount setting. If the shift amount is greater than the maximum amount it is either (1) stored into the P variable or (2) optionally set to a value of 0.00mm (zero) and then stored into the P variable. The “Status Msg Bvar#” argument is also set to a value signifying that the Maximum Shift Amount has been exceeded.
   e) Gap Size Dvar#: defines the D variable number that will contain the measured size of the joint gap. If the macro is configured to obtain area, mismatch, and normal angle, then these values will be stored in the D variables immediately after gap.
   f) # retry on failu: The number of times to retry a measurement if any error is detected.
4 Programming

4.1 New Weld Joint

g) Alarm on failure: In addition to populating the Bvar with an error code, the system can optionally alarm in the event of a failure. This will stop robot motion.

h) Don't Mute Laser: If it is known that this measurement will be followed by subsequent measurements, you can optionally leave the laser visible after execution. This should only be used in applications where cycle time is very critical.

7. Program the Ref Position such that the weld seam is in range of the laser sensor (automatically or manually) and that a tracking point can be established by the laser sensor.

8. Program the weld path.

9. Deploy the {SFTON} instruction(s) into the weld job, referencing the P Variable number registered in step 6c and (optionally) combine with other measured P variable shift amounts if needed (contact Customer Support, if needed).

NOTICE

If using coordinated motion during execution of the shift amount, use the {SSFTON} and {SSFTOF} command. Make sure that use of the {CNVRT} command is used for this conversion process. When programming the job with these functions make sure that the {CNVRT} command is used prior to the {SSFTON} and immediately after execution of the L*-SF macro. The Master Tool Frame shift amounts should be used as a target for the conversions.
4.2  Robot Programming

The control interface of the robot to the SF sensor is through a L*-SF (ie. L1-SF, L2-SF, L3-SF, and L4-SF) macro job. Every time a location is to be detected on the weld joint or part feature a L*-SF macro instruction needs to be registered. Execution of the L*-SF macro instruction will manage communication with the sensor.

4.2.1 Detecting a Weld Seam

For weld seams to be detected, the following steps needs to be taken.

1. Insert a L*-SF macro instruction into the robot job (done by [INFORM LIST] > {MACRO}).

2. Position the camera so the laser is on the weld joint roughly perpendicular to the weld seam.

3. Set remaining arguments of the L*-SF macro instruction.
   • See Fig. "" for details.

4. Insert other L*-SF macro instructions and teach the sensor to the weld joints if needed.

5. Set remaining arguments of the L*-SF macro instruction as needed.

6. Condition/combine/calculate shift amounts made by the L*-SF macro instructions in the previous step.

7. Insert {SFTON}/{SFTOF} (or {SSFTON}/{SSFTOF}) instruction(s) into the weld path section of the robot job.
4.2.2 Programming the Sensor over the Weld Joint

Once properly programmed to the weld joint, the laser sensor will provide an offset (i.e. how far the new part is located from the original taught part). This offset is calculated from the nominal position in the camera’s field of view. The further the weld joint or tracking point is from this nominal position, the larger the calculated offset will be.

To program the camera to the nominal position, it is recommended to use the following procedure:

1. Insert the L*-SF macro instruction into the robot job above the {ARCON} instruction.
   - The instruction can be accessed from [INFORM LIST] > {MACRO}.
   - This macro instruction after insertion, should have the following structure (although the data of each argument may differ from Fig. 4-1).

   **Fig. 4-1: Macro Instruction**

   ```
   L1-SF-INSPECT Task:0 Bit:0 Teach:1 Pvar:0 Ovar:0
   ```

2. Open the Argument Setting screen of the L*-SF macro instruction.
   - To open the instruction, cursor to the instruction side of the instruction and press [SELECT] two times.

   **Fig. 4-2: Argument Setting**

   ![Argument Setting Screen](image)

Table 4-1: Arguments of the L*-SF-INSPECT Macro Instruction

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
<th>Data Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Don’t Mute Laser</td>
<td>Set this to “1” to leave the laser unmuted at the end of the L*-SF routine</td>
<td>1 = Do not mute</td>
</tr>
</tbody>
</table>

3. Verify that each parameter is set correctly for the application.
   - For example, adjust the Max Shift Amount to no greater than the maximum shift amount that is expected to be experienced. Erroneous measurements during the search attempt may result in a crash with the robot.

4. Move the robot into position over the part.
   - Make sure you have a stable tracking point using Weldcom software on the PC.
   - [MODIFY] > [ENTER] the current robot position in the RefPosition.

5. Set the Teach Mode parameter to a value of “1”.

6. Press [ENTER] > [ENTER] to save all the displayed argument settings.

7. Press and hold [INTERLOCK] + [TEST START] to execute the routine.
   - If everything is working properly the laser should turn on, the robot should move slightly closer to the weld joint and then a message should be displayed on the bottom of the teach pendant instructing the user to “ReModify the RefPosition, and set Teach Mode to 0.”

8. Re-open the argument setting screen of the L*-SF macro instruction.
   - From the instruction side of the macro press [ENTER] > [ENTER].

9. Place the cursor over the RefPosition parameter and press [MODIFY] > [ENTER] to capture the newly defined position of the camera over the weld joint.

10. Set the Teach Mode parameter to a value of “0”.

11. Press [ENTER] > [ENTER] to save all the displayed argument settings.
   - The L*-SF macro instruction is now programmed to this specific location of the weld joint.

12. Repeat the above process for each weld joint location to be detected.

**NOTICE**

If the AutoTeach mode is successful, the robot moves such that the laser sensor measures a Nominal Z Position of 150.0 mm (this value is adjustable, and is set inside the L*-SF macro job and can be changed, SYSTEM WIDE) and Nominal Y Position 0.0 mm (corresponding to the center of the field of view). These measurements can be observed from the Weldcom portal as well. As the weld seam varies, the vision system measurements are compared to these two nominal values and shift offsets are made based on the distance between: taught Nominal Z Position (150.0 mm) - measured Nominal Z Position = Z offset; Nominal Y Position (center of field of view, or 0 mm) - measured Nominal Y Position = Y offset.
4.2.3 Advanced Control

The SF*-ADV macro is provided for users who desire advanced control/calculation abilities. This macro is intended for use by users who are experienced with the Servo-Robot product and familiar with position calculations.

**NOTICE**

The advanced macro does not perform any calculations on the raw data returned from the SF sensor. Therefore, it does not provide the positional offset data which can be obtained from the L*-SF macro.

This job is useful for users who want to calculate their own joint geometry given the raw data returned from the Servo-Robot sensor. It can also be used to perform an individual task, without doing an entire cycle of [Set Task] - [Unmute] - [Measure] - [Calculate] - [Mute] - [Check Status]. Users can pick and choose any or all of the functions to perform.

**NOTICE**

If multiple tasks are enabled in the SF*-ADV macro, they will execute in the order that they appear in the argument list below.

---

<tr>
<td>Error Check</td>
<td>This will perform a GET STATUS action, and then display any appropriate alarms and/or error messages accordingly.</td>
<td>1 = Perform error check</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0 = Do not perform error check</td>
</tr>
<tr>
<td>Err Code B-Var</td>
<td>This is the index of a robot B-variable which will be populated with an error code if an error condition exists. After executing the macro, this B-variable can be checked to determine if the measurement data is valid. See Appendix A.1.2 for a lookup table to determine the definition of each possible value.</td>
<td>0 - 99</td>
</tr>
</tbody>
</table>
4.2.4 Deployment

As previously mentioned, the L*-SF macro instruction needs to be programmed each time the user wishes to measure for part deviation.

Simple weld joints will only need one macro instruction.

For longer weld joints, or weld joints experiencing multi-dimensional variation (ie. X, Y, and Z), multiple L*-SF macros will need to be programmed into the job. Carefully combine/condition resulting shift amounts to get full shift amounts.

4.2.4.1 Status Message

Every execution of the L*-SF macro will save a value to a B variable. The value written to this variable corresponds to a Status Message. In the event the L*-SF macro was unsuccessful, these messages will give the robot program a value to base corrective action on. The list of possible Message Codes, their descriptions, and recommended corrective action is shown in Appendix A section of this document.

The variable number used to store the Status Message code is user definable based on the “StatusMessageBvar#” parameter of the L*-SF macro instruction. For example, if the user sets StatusMessageBvar# to a value of 44, the B044 will receive a value (0 through 16) upon execution of the L*-SF macro. In general, a value of 0 or 1 corresponds to a successful execution of the routine, and a value between 2-16 denotes unsuccessful execution. It is up to the user what the robot job’s code will do with this data. For example, if the robot program receives a value of 9 (no joint detected) then the robot program could re-try the L*-SF but with a shifted detection position (ie. executing a {SFTON} before executing the L*-SF macro). If a received value of 7 (Maximum shift amount exceeded) then the robot program may be structured and to skip the weld and notify the PLC that the weld joint positioning is out of limits. In the event a User Message occurs (Alarm 8000 series and labeled “L*-SF Comm Alarm: xxxxxx”) user should note the full description of the alarm and contact Customer Support Group.

4.2.4.2 Short Welds

If the weld lengths are very short and/or the amount of variation of the weld start and weld end are virtually the same measurement, only one L*-SF macro may be needed. In this example, the P variable is P000 (to modify robot path). Even though a value is always written to the measured Gap D variable, for this weld joint, the D variable is not being used. See Fig. 4-4 “Example of a Short Weld Job” for sample programming.

Fig. 4-4: Example of a Short Weld Job
4 Programming

4.2 Robot Programming

### 4.2.4.3 Long Welds

For longer weld lengths where the start point may vary by a different amount and/or direction than the end position, multiple measurements would be required. Normally two measurements are made. One at weld start and one at weld end.

*Fig. 4-5: Example of a Long Weld Job*

In *Fig. 4-5*, two L*-SF macro instructions have been inserted and taught. The first instruction, programmed at the start position of the weld joint, saves the shift amount to P000 and the gap measurement to D000. The second instruction utilizes P001 and D001. Before the first weld position is reached, a Shift Amount is registered using P000, and before the second weld position is reached the other Shift Amount is executed using the amount in P001.

### 4.2.4.4 Adaptive Weaving

An additional feature of the L*-SF macro is the ability to collect a gap measurement and then use this measurement to affect welding parameters using the \{WVADJ\} (weave adjust) instruction.

*NOTICE*

The \{WVADJ\} instruction is an optional function that must be enabled into the Robot Controller. Contact Customer Support if needing to have this enabled in the Robot Controller.
4 Programming

4.2 Robot Programming

Fig. 4-6: Example of a Adaptive Weaving Job

In Fig. 4-6, all robots and L*-SF macro instructions programmed are just like that of the Long Welds example above. However, in addition to using the P variables to adjust weld path via the {SFTON} instruction, the {WVADJ} instruction deploys to adjust the Weave Amplitude and Travel Speed between the two weld positions.

The {WVADJ} instruction behaves such that the Start Gap, or ST= parameter, and the End Gap, or END= parameter are compared to the Standard Gap, or STD= parameter, and target values for both weave amplitude and travel speed are calculated for the weld start and weld end position. The weaving amplitude and travel speed are smoothly interpolated, or sloped, between these two points. The weave amplitude is adjusted based on its nominal value - the value referenced by the {WVON} instruction, and in this case saved in the weave file. The travel speed is adjusted based on its nominal value set in either the job (by a SPEED= instruction or referenced by the MOV instruction of the second weld point) or by the (ARCON) instruction (by the SPD: Robot Speed field of the Arc Start File).

4.2 Robot Programming

4.2.5 Tips for Improving Cycle Time

• The time required to take a measurement varies greatly based on the weld profile setup in the Weldcom software. Simplifying the parameters of a weld joint can have the largest impact on cycle time.

• Do not mute the laser between a series of back-to-back measurements.
  – The Lx-SF macro has a parameter “Do Not Mute Laser”. This will leave the laser unmuted after measurement is complete. Not only will skipping this action save time, you will save more time on your next measurement since the laser is already unmuted.
  – When all your measurements for the weld seam are complete, be sure to mute the laser. This can be done by setting the “Do Not Mute Laser” argument to 0 on your last measurement. Or, the SF-ADV macro can be called to mute the laser without performing other actions.

• Do not switch task number between a series of back-to-back measurements.
  – Switching task number inside the SF sensor is the second largest consumer of cycle time. However, it is common to perform a series of back-to-back measurements using the same task.
  – The Lx-SF macro contains an argument for Task Number. If a number is specified, it will always try to change task, regardless of the currently selected task. However, by placing a “-1” in this argument, the macro will skip task selection and use the currently selected task for the measurements.
  – Additionally, the SFx-ADV macro can be used to select a task number without performing other actions. This is useful at the start of a robot job which performs a series of measurements.
Appendix A

A.1 Output Messages

A.1.1 Lx-SF Macro

The Status Msg Bvar# parameter sets the B variable number specified in the L*-SF macro with the status of the joint locating routine. The value of this B variable can then be used to skip welds (in the event the measured offset amount is outside of a user defined allowable window), alert a PLC, or execute another user-defined routine.

In addition to the Status Msg Bvar, the Lx-SF macro routine will print a status message at the bottom of the pendant display. In the event of an error, the macro can optionally raise an alarm as well.

The possible messages are listed in Table A-1.

**NOTE:** The measurement limits for the weld joint are set using Servo-Robot's Weldcom software.
Appendix B

B.1 Communication Setup

The SF communication driver is controlled through the robot’s M Registers and Universal Inputs/Outputs. In Fig. B-1 “L1-SF Macro Job Example”, a series of LI variables are set to reference which M Reg number uses each communication point. They are set internally in the Lx-SF macro. For multiple-laser systems, like an R1 + R2 system where each robot has its own laser sensor, the L2-SF (and L3-SF) macro job uses different M Reg numbers for control of the communication driver.

NOTICE

These register I/O addresses are for reference only and should not be modified by the user.
