SECTION 1
INTRODUCTION

The ArcWorld II-200 is part of the ArcWorld family of standardized arc welding solutions. It is a fully integrated welding system, and is supported from wire to weld by Motoman, Inc.

The ArcWorld II-200 features a Motoman arc welding robot and XRC controller with menu-driven arc welding application software, complete welding package, two stationary weld tables, operator interface, and total safety environment.

1.1 About this Document

This manual is intended as an introduction and overview for personnel who have received operator training from Motoman, and who are familiar with the operation of this Motoman robot model. For more detailed information, refer to the manuals listed in Section 1.3. This manual contains the following sections:

SECTION 1 - INTRODUCTION
This section provides general information about the ArcWorld II-200 and its components, a list of reference documents, and customer service information.

SECTION 2 - SAFETY
This section provides information regarding the safe use and operation of the ArcWorld II-200 system.

SECTION 3 - DESCRIPTION OF EQUIPMENT
This section provides a detailed description of the major components of the ArcWorld II-200 system. This section also includes a table of component specifications.

SECTION 4 - INSTALLATION
This section provides instructions for set up and installation of the ArcWorld II-200 system.

SECTION 5 - OPERATION
This section provides instructions for basic operation of the ArcWorld II-200 system. This section also provides procedures for start-up, loading, normal operation, fault recovery, and shutdown. A number of sample robot programs are also included in this section.

SECTION 6 - MAINTENANCE
This section contains a table listing periodic maintenance requirements for the components of the ArcWorld II-200 cell.
1.2 System Overview

The ArcWorld II-200 provides a complete arc welding solution in a standardized configuration. The system is designed around a Motoman arc welding robot and XRC robot controller, and includes a complete welding package. Two stationary tables allow an operator to prepare and set up parts on one table while the robot welds on the other table. The cell provides a full complement of safety features designed to protect both personnel and equipment. Figure 1-1 illustrates the system layout of the ArcWorld II-200 cell.

1.2.1 System Layout

The robot manipulator and weld tables share a common base for ease of installation and to help maintain proper alignment between the cell’s components. The XRC controller and welding power source also share a common base, but separate from the cell’s base. The robotic cell is fully enclosed by safety fencing and an interlocking door. Interlocked operator doors allow the operator to load parts on one table while the robot is welding parts on the other table. All operator controls, including those on the XRC and welding power supply, are accessible from outside of the robotic enclosure.

Figure 1-1 System Layout

NOTE: This manual is for a standard Motoman system. If your system is a custom or modified system, please use the drawing and Bill of Material (BOM) provided with the system for troubleshooting and spares provisioning.
1.2.2 **Major Components**

The ArcWorld II-200 includes the following major components:

- Motoman or UP6 or UP20 manipulator and XRC controller
- Two stationary welding tables
- Two operator stations
- Welding equipment, including the following:
  - MotoArc welding power source
  - Motoman torch (water-cooled or air-cooled)
  - Wire feeder
  - Torch mount
- Safety equipment, including the following:
  - Safety fencing with arc curtains
  - Interlocked cell door
  - Arc doors
  - Zone ring

1.2.3 **Optional Equipment**

The following equipment is available for use with the ArcWorld II-200:

- Torch tender
- Wire cutter
- Com-Arc III seam tracking unit
- Water circulator

1.3 **Reference to Other Documentation**

For additional information refer to the following:

- Motoman UP6 Manipulator Manual (P/N 142104-1)
- Motoman UP20 Manipulator Manual (P/N 145887-1)
- Motoman Operator's Manual for Arc Welding (P/N 142098-1)
- Motoman Concurrent I/O Parameter Manual (P/N 142102-1)
- Com-Arc III Instruction Manual (P/N 132753-1)
- Vendor manuals for system components not manufactured by Motoman

1.4 **Customer Service Information**

If you are in need of technical assistance, contact the Motoman service staff at (937) 847-3200. Please have the following information ready before you call:

- Robot Type (UP6 or UP20)
- Application Type (welding)
- System Type (ArcWorld II-200)
- Software Version (3.74A)
- Robot Serial Number (located on the back side of the robot arm)
- Robot Sales Order Number (located on back side of XRC controller)
SECTION 2
SAFETY

2.1 Introduction

It is the purchaser's responsibility to ensure that all local, county, state, and national codes, regulations, rules, or laws relating to safety and safe operating conditions for each installation are met and followed.

We suggest that you obtain and review a copy of the ANSI/RIA National Safety Standard for Industrial Robots and Robot Systems. This information can be obtained from the Robotic Industries Association by requesting ANSI/RIA R15.06. The address is as follows:

Robotic Industries Association
900 Victors Way
P.O. Box 3724
Ann Arbor, Michigan  48106
TEL: (734) 994-6088
FAX: (734) 994-3338

Ultimately, the best safeguard is trained personnel. The user is responsible for providing personnel who are adequately trained to operate, program, and maintain the robot cell. The robot must not be operated by personnel who have not been trained!

We recommend that all personnel who intend to operate, program, repair, or use the robot system be trained in an approved Motoman training course and become familiar with the proper operation of the system.

This safety section addresses the following:

- Standard Conventions (Section 2.2)
- General Safeguarding Tips (Section 2.3)
- Mechanical Safety Devices (Section 2.4)
- Installation Safety (Section 2.5)
- Programming Safety (Section 2.6)
- Operation Safety (Section 2.7)
- Maintenance Safety (Section 2.8)
2.2 Standard Conventions

This manual includes information essential to the safety of personnel and equipment. As you read through this manual, be alert to the four signal words:

- DANGER
- WARNING
- CAUTION
- NOTE

Pay particular attention to the information provided under these headings which are defined below (in descending order of severity).

DANGER!
Information appearing under the DANGER caption concerns the protection of personnel from the immediate and imminent hazards that, if not avoided, will result in immediate, serious personal injury or loss of life in addition to equipment damage.

WARNING!
Information appearing under the WARNING caption concerns the protection of personnel and equipment from potential hazards that can result in personal injury or loss of life in addition to equipment damage.

CAUTION!
Information appearing under the CAUTION caption concerns the protection of personnel and equipment, software, and data from hazards that can result in minor personal injury or equipment damage.

NOTE: Information appearing in a NOTE caption provides additional information which is helpful in understanding the item being explained.
2.3 General Safeguarding Tips

All operators, programmers, plant and tooling engineers, maintenance personnel, supervisors, and anyone working near the robot must become familiar with the operation of this equipment. All personnel involved with the operation of the equipment must understand potential dangers of operation. General safeguarding tips are as follows:

- Improper operation can result in personal injury and/or damage to the equipment. Only trained personnel familiar with the operation of this robot, the operator's manuals, the system equipment, and options and accessories should be permitted to operate this robot system.
- Do not enter the robot cell while it is in automatic operation. Programmers must have the teach pendant when they enter the robot cell.
- Improper connections can damage the robot. All connections must be made within the standard voltage and current ratings of the robot I/O (Inputs and Outputs).
- The robot must be placed in Emergency Stop (E-STOP) mode whenever it is not in use.
- In accordance with ANSI/RIA R15.06, section 6.13.4 and 6.13.5, use lockout/tagout procedures during equipment maintenance. Refer also to Section 1910.147 (29CFR, Part 1910), Occupational Safety and Health Standards for General Industry (OSHA).

2.4 Mechanical Safety Devices

The safe operation of the robot, positioner, auxiliary equipment, and system is ultimately the user's responsibility. The conditions under which the equipment will be operated safely should be reviewed by the user. The user must be aware of the various national codes, ANSI/RIA R15.06 safety standards, and other local codes that may pertain to the installation and use of industrial equipment. Additional safety measures for personnel and equipment may be required depending on system installation, operation, and/or location. The following safety measures are available:

- Safety fences and barriers
- Light curtains
- Door interlocks
- Safety mats
- Floor markings
- Warning lights

Check all safety equipment frequently for proper operation. Repair or replace any non-functioning safety equipment immediately.
2.5 Installation Safety

Safe installation is essential for protection of people and equipment. The following suggestions are intended to supplement, but not replace, existing federal, local, and state laws and regulations. Additional safety measures for personnel and equipment may be required depending on system installation, operation, and/or location. Installation tips are as follows:

- Be sure that only qualified personnel familiar with national codes, local codes, and ANSI/RIA R15.06 safety standards are permitted to install the equipment.
- Identify the work envelope of each robot with floor markings, signs, and barriers.
- Position all controllers outside the robot work envelope.
- Whenever possible, install safety fences to protect against unauthorized entry into the work envelope.
- Eliminate areas where personnel might get trapped between a moving robot and other equipment (pinch points).
- Provide sufficient room inside the workcell to permit safe teaching and maintenance procedures.

2.6 Programming Safety

All operators, programmers, plant and tooling engineers, maintenance personnel, supervisors, and anyone working near the robot must become familiar with the operation of this equipment. All personnel involved with the operation of the equipment must understand potential dangers of operation. Programming tips are as follows:

- Any modifications to PART 1 of the controller PLC can cause severe personal injury or death, as well as damage to the robot! Do not make any modifications to PART 1. Making any changes without the written permission of Motoman will VOID YOUR WARRANTY!
- Some operations require standard passwords and some require special passwords. Special passwords are for Motoman use only. YOUR WARRANTY WILL BE VOID if you use these special passwords.
- Back up all programs and jobs onto a floppy disk whenever program changes are made. To avoid loss of information, programs, or jobs, a backup must always be made before any service procedures are done and before any changes are made to options, accessories, or equipment.
- The concurrent I/O (Input and Output) function allows the customer to modify the internal ladder inputs and outputs for maximum robot performance. Great care must be taken when making these modifications. Double-check all modifications under every mode of robot operation to ensure that you have not created hazards or dangerous situations that may damage the robot or other parts of the system.
- Improper operation can result in personal injury and/or damage to the equipment. Only trained personnel familiar with the operation, manuals, electrical design, and equipment interconnections of this robot should be permitted to operate the system.
• Inspect the robot and work envelope to be sure no potentially hazardous conditions exist. Be sure the area is clean and free of water, oil, debris, etc.
• Be sure that all safeguards are in place.
• Check the E-STOP button on the teach pendant for proper operation before programming.
• Carry the teach pendant with you when you enter the workcell.
• Be sure that only the person holding the teach pendant enters the workcell.
• Test any new or modified program at low speed for at least one full cycle.

2.7 Operation Safety

All operators, programmers, plant and tooling engineers, maintenance personnel, supervisors, and anyone working near the robot must become familiar with the operation of this equipment. All personnel involved with the operation of the equipment must understand potential dangers of operation. Operation tips are as follows:

• Be sure that only trained personnel familiar with the operation of this robot, the operator's manuals, the system equipment, and options and accessories are permitted to operate this robot system.
• Check all safety equipment for proper operation. Repair or replace any non-functioning safety equipment immediately.
• Inspect the robot and work envelope to ensure no potentially hazardous conditions exist. Be sure the area is clean and free of water, oil, debris, etc.
• Ensure that all safeguards are in place.
• Improper operation can result in personal injury and/or damage to the equipment. Only trained personnel familiar with the operation, manuals, electrical design, and equipment interconnections of this robot should be permitted to operate the system.
• Do not enter the robot cell while it is in automatic operation. Programmers must have the teach pendant when they enter the cell.
• The robot must be placed in Emergency Stop (E-STOP) mode whenever it is not in use.
• This equipment has multiple sources of electrical supply. Electrical interconnections are made between the controller, external servo box, and other equipment. Disconnect and lockout/tagout all electrical circuits before making any modifications or connections.
• All modifications made to the controller will change the way the robot operates and can cause severe personal injury or death, as well as damage the robot. This includes controller parameters, ladder parts 1 and 2, and I/O (Input and Output) modifications. Check and test all changes at slow speed.
2.8 Maintenance Safety

All operators, programmers, plant and tooling engineers, maintenance personnel, supervisors, and anyone working near the robot must become familiar with the operation of this equipment. All personnel involved with the operation of the equipment must understand potential dangers of operation. Maintenance tips are as follows:

- Do not perform any maintenance procedures before reading and understanding the proper procedures in the appropriate manual.
- Check all safety equipment for proper operation. Repair or replace any non-functioning safety equipment immediately.
- Improper operation can result in personal injury and/or damage to the equipment. Only trained personnel familiar with the operation, manuals, electrical design, and equipment interconnections of this robot should be permitted to operate the system.
- Back up all your programs and jobs onto a floppy disk whenever program changes are made. A backup must always be made before any servicing or changes are made to options, accessories, or equipment to avoid loss of information, programs, or jobs.
- Do not enter the robot cell while it is in automatic operation. Programmers must have the teach pendant when they enter the cell.
- The robot must be placed in Emergency Stop (E-STOP) mode whenever it is not in use.
- Be sure all safeguards are in place.
- Use proper replacement parts.
- This equipment has multiple sources of electrical supply. Electrical interconnections are made between the controller, external servo box, and other equipment. Disconnect and lockout/tagout all electrical circuits before making any modifications or connections.
- All modifications made to the controller will change the way the robot operates and can cause severe personal injury or death, as well as damage the robot. This includes controller parameters, ladder parts 1 and 2, and I/O (Input and Output) modifications. Check and test all changes at slow speed.
- Improper connections can damage the robot. All connections must be made within the standard voltage and current ratings of the robot I/O (Inputs and Outputs).
SECTION 3
EQUIPMENT DESCRIPTION

3.1 UP-series Robot Description

The Motoman UP6 and UP20 robots and XRC 2001 robotic controller represent state-of-the-art technology in robotics today. The six-axis UP6 robot has a payload of 6 kg (13.2 lbs). It features a 1,373 mm (54.05 inch) reach and has a relative positioning accuracy of ± 0.08 mm (0.004 inch). The six-axis UP20 robot has a payload of 20 kg (44.09 lbs). It features a 1658 mm (65.2 inch) reach and has a relative positioning accuracy of ± 0.1 mm (0.004 inch).

Each robot can reach below its own base as well as behind itself and can be mounted on the floor, wall, or ceiling with few modifications. However, the S-axis has been restricted by hardstops for use in this system. For more information, refer to the manipulator manual that came with your system.

3.2 XRC Controller

The XRC robotic controller, shown in Figure 3-1, coordinates the operation of the ArcWorld II-200 system. It controls manipulator movement and welding power supply, processes input and output signals, and provides the signals to operate the welding system. It maintains variable data and performs numeric processing to convert to and from different coordinate systems. In addition, the controller provides the following: main logic functions, servo control, program and constant data memory, and power distribution. For more information, refer to the manipulator manual that came with your system.

![Figure 3-1 XRC Controller](image)
3.2.1 Playback Panel

The playback panel (see Figure 3-2) contains the primary system controls and consists of the features described below. For more information, refer to the manipulator manual that came with your system.

![Figure 3-2 XRC Playback Panel](image)

**Servo On Ready**
The SERVO ON READY pushbutton turns servo power ON. The switch lights when servo power is on. In TEACH mode, the SERVO ON READY pushbutton operates only when the TEACH LOCK button on the programming pendant is ON and the ENABLE switch on the programming pendant is held in.

**Mode**
The Mode push buttons (PLAY, TEACH and REMOTE) set the robot’s mode of operation.

*NOTE: Changing modes from PLAY to TEACH, during playback, will cause the program to cease execution (similar to HOLD); to resume operation, press PLAY and then START.*

**Alarm/Error**
The ALARM/ERROR indicator light turns ON whenever an alarm or error condition occurs.

**Emergency Stop (E-STOP)**
The E-STOP button on the playback panel is connected in series with the system Emergency Stop circuit. Pressing E-STOP ceases all system operation.

**Start**
Pressing the START button while in PLAY mode with servo power on, causes playback execution of the current job to begin.

**Hold**
The HOLD button is a normally closed, momentarily actuated switch. Pressing HOLD halts operation of the manipulator until another Start signal is sent.
3.2.2 **Programming Pendant**

The programming pendant (see Figure 3-3) is the primary user interface for the system. The pendant has a 4x5-inch 12-line, 40-character LCD display and keypad. The system uses the INFORM II robot language and a menu-driven interface to simplify operator interaction with the robot. By using the pendant, the operator can teach robot motion, and perform programming, editing, maintenance, and diagnostic functions. The programming pendant consists of the items described below. For more information, refer to the manipulator manual that came with your system.

**NOTE:** The programming pendant LCD display goes dark after a few minutes of inactivity. Press any key to restore screen.

*Figure 3-3  Programming Pendant*

**General Purpose Display Area**

The General Purpose Display Area displays the currently selected menu choice.

**Menu Area**

The Menu Area contains menu selections for the currently selected screen.

**Emergency Stop (E-STOP)**

The E-STOP button on the programming pendant is connected in series with the system Emergency Stop circuit. Pressing the E-STOP button interrupts this circuit and stops all system operation.

**Keypad**

The user keypad on the programming pendant serves as an input device. The keys are grouped into different functional sections to simplify operator use.
**Status Area**
The Status Area shows system status via the following symbols:

- **Active Robot, External Axis, or Base Axis**
  R1, R2, R3; S1, S2, etc.; or B1, B2, etc.

- **Coordinate System**
  Joint, World, Cylindrical, Tool, or User Frame

- **Manual Speed Setting**
  Inching, Low, Medium, or High

- **Cycle Mode**
  Step, 1-Cycle, or Auto

- **System Status**
  E-Stop, Stop, Running/Start, Hold, or Alarm

- **Additional Pages** (when applicable)

**TOP MENU Key**
The TOP MENU key returns the pendant display to the initial start-up menu. The cursor key can then be used to choose from the following menu icons:

- **JOB**
  This icon accesses job selections including: Master Job, Select Job, Job Capacity, and Create New Job while in TEACH mode.

- **ARC WELDING, GENERAL, HANDLING, and SPOT WELDING**
  This icon allows you to select the applications available to the controller.

- **VARIABLE**
  This icon accesses the display and editing menu for the arithmetic variables and display of position variables.

- **IN/OUT**
  This icon accesses DETAIL and SIMPLE displays of all XRC I/O signals. In EDITING or MAINT. mode, Universal Outputs can be forced ON or OFF.

- **ROBOT**
  This icon accesses robot information including: CURR.POS, POWER ON/OFF, POS, COMMAND POS, SECOND HOME POS, OPE ORIGIN POS, and TOOL and USER COORDINATE.

- **SYSTEM INFO**
  This icon provides Version information for both hardware and software, Alarm History, and Monitoring Time.

**Area Key**
The Area key moves the cursor to the different areas of the display screen.

**Cursor Key**
The Cursor key is an 8-way, directional key that moves the up, down, left or right to highlight a desired item that can then be chosen using the SELECT key.
**SELECT Key**

The SELECT key is used to choose the item currently highlighted by the cursor.

**TEACH LOCK Key**

The TEACH LOCK key locks operation of the robot with the programming pendant. Operation is not possible from the playback panel or operator station. Servo power can not be applied in TEACH mode unless TEACH LOCK is ON.

**RS-232C Serial Port**

This 9-pin serial port is used for data communication between the XRC and a floppy disk controller (FC1 or FC2), FDE (Floppy Disk Emulator) software, or other form of communication (see Figure 3-4).

![Figure 3-4 RS-232C Serial Port](image-url)

**ENABLE Switch**

The ENABLE switch (see Figure 3-5) is a three-position switch located on the left rear of the programming pendant. It is a safety feature that controls servo power while in TEACH mode. When pressed in, this switch enables servo power to be turned on. However, should the operator release the switch, or grasp it too tightly, servo power is immediately disabled, preventing further robot movement.

![Figure 3-5 Enable Switch](image-url)
3.2.3 Brake Release

**WARNING!**
Releasing brakes could cause personal injury or machine damage. Always support the axis to be released BEFORE you release it.

The Brake Release Control is a safety feature that allows you to release the automatic brakes on the robot in case of an emergency or robot failure. The Brake Release Control is mounted on the front of the XRC cabinet (see Figure 3-1).

3.3 Operator Station

The ArcWorld II-200 has two identical operator stations (see Figure 3-5). They are mounted on the right-hand door support of both stations. The operator station consists of the items described in the following paragraphs.

![Figure 3-6 Operator Station](image)

3.3.1 Cycle Start

**WARNING!**
The operation of the CYCLE START palm buttons is dependent on the structure of the Master job. Altering the Master job could result in injury to personnel or damage to the equipment.

The CYCLE START push button, located at the top of the op-station, completes the CYCLE START circuit when the operator presses this button. The operator door closes and the robot moves to the appropriate station. The following is an example of typical operation:

The CYCLE START push button on Station 1 is activated, sending a signal to IN#1 “CYCLE START INPUT.” The robot moves to the HOME 1 position. The XRC turns on OT#2 “CLOSE OPERATOR DOOR.” Switches located on the operator door verify operator door closed and a signal is sent to IN#2 “OK TO WORK.” The robot is now able to enter the work area and perform the assigned job.
3.3.2 **Door Status**

The DOOR STATUS button allows the operator to reopen a station after the operator door has closed. This is used primarily to reopen the operator door if part/fixture adjustments are required after the operator has already pressed CYCLE START and the operator door has closed. DOOR STATUS is disabled if the robot is presently working at the station.

3.3.3 **Emergency Stop (E-STOP)**

The operator station E-STOP button is connected in series with the system Emergency Stop circuit. Pressing the E-STOP button interrupts this circuit and stops all system operation. Brakes are applied to the robot and all servo power is removed from the system. All door motion is also stopped.

**NOTE:** The operator door may continue to move after an E-STOP occurs due to air pressure.

3.4 **Stationary Weld Tables**

The ArcWorld II-200 features two weld tables (stations), each with a door that protects the operator from arc radiation, weld splatter, and physical contact with the robot arm. When the robot is finished working, the door lowers, giving the operator access to unload and reload parts from the fixture.

**NOTE:** In high humidity areas, use surface protection to prevent corrosion of the tooling plates.

### Table 3-1 Specifications

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Specifications</th>
</tr>

</tbody>
</table>
3.5 **Welding Equipment**

The ArcWorld system provides a complete complement of arc welding equipment. In its standard configuration, the ArcWorld system includes a power source, wire feeder, torch, and torch mount. Optional equipment including water circulators, Com-Arc units, and torch tenders may also be included with your system.

### 3.5.1 Power Sources

Motoman offers several different power sources for use with the ArcWorld II-200 system depending on your system’s application. The following are some of the more common power sources used. However, the power source your system uses may be different. For more specific information, refer to the vendor manual that came with your system.

*Figure 3-7  Available Power Sources*
3.5.2 **PWF4 Wire Feeder**

The PWF4 wire feeder mounts on the robot arm. This 4-roll wire feeder provides reliable wire feeding at rates up to 750 inches per minute (IPM). An integral gas valve provides fast gas response time. The wire feeder has an inch forward button to help simplify set-up and reduce change-over time. Interchangeable feed rolls are used to accommodate different types and sizes of wire. A Shock Sensor Override switch located on the front of the feeder is used to recover from torch impact.

3.5.3 **Universal Welding Interface (UWI)**

The UWI provides microprocessor control to the wire feeder and MotoArc series power source. It scales the signals from the XRC controller to the appropriate levels required for control of the welding components. It also provides isolation of the power source analog signals.

*NOTE:* Some power sources available with the ArcWorld II-200 system do not use the UWI. For more information specific to your system, refer to the vendor manuals shipped with your system.

3.5.4 **GMAW Torch**

The ArcWorld system uses either an air-cooled or a water-cooled robotic/automatic GMAW torch. These are heavy-duty torches designed for quick replacement while requiring minimum robot reprogramming. The GMAW torch is installed at the end of the robot wrist. For applications that use the water-cooled torch, the ArcWorld system includes a suitable water circulator kit.

3.5.5 **Motoman Torch Mount**

A Motoman Torch Mount protects the robot, workpiece, fixture, and positioner. It provides multi-directional impact detection, including Z-axis collisions. Torch impact causes a system E-STOP and immediately stops all system operation. Servo power is removed from the system and brakes are applied to the robot. All positioner and door motion is also stopped.

3.6 **Safety Features**

The ArcWorld II-200 system incorporates a host of safety equipment. When all standard safety precautions are taken, the safety equipment helps to ensure safe operation of the robotic cell. The ANSI/RIA R15.06 Robot Safety Standard stipulates the user is responsible for safeguarding. *Users are responsible for determining whether the provided safeguards are adequate for plant conditions. Users must also ensure that safeguards are maintained in working order.*

3.6.1 **Arc Screens**

**WARNING!**

*Although the arc curtain blocks dangerous arc radiation, never look directly at the arc without protective eyewear!*

Two separate arc screens are used on the ArcWorld II-200 system. The first is a metal arc screen on the positioner. This screen blocks arc radiation and sparks from the welding operation. The material used to cover the safety fencing of the entire robotic cell acts as the second arc screen. This material reduces the amount of ultraviolet radiation that escapes from the robotic cell.
3.6.2 **Fencing**

The safety fencing provided with the ArcWorld II-200 system encloses the entire robotic cell. It forms a physical barrier preventing entry into the robot envelope during automatic operation.

3.6.3 **Emergency Stops (E-STOPS)**

In addition to the safety features described above, the ArcWorld II-200 has strategically placed E-STOPS. These are operator actuated devices that, when activated, immediately stop all system operation. Brakes are applied to the robot and all servo power is removed from the system. The system E-STOP lights come on and all positioner motion is stopped. The following is a list of their locations:

- The playback panel on the controller has one E-STOP button.
- The programming pendant has one E-STOP button.
- The operator station has one E-STOP button.

3.6.4 **ENABLE Switch**

The ENABLE switch is a safety feature which controls servo power while in TEACH mode. When pressed in, this switch allows the operator to turn servo power ON and initializes the system. However, should the operator release the switch or grasp it too tightly, servo power is immediately disabled, preventing further robot movement. For detailed information about the operation of the ENABLE switch, refer to the XRC section in the manipulator manual that came with your system.

3.6.5 **Interlocked Cell Door**

A safety interlock on the cell entrance door prevents entry into the cell during PLAY mode. Opening the cell door with the robot in PLAY causes an E-STOP. Brakes are applied to the robot and all servo power is removed from the system. The system E-STOP lights come on and all positioner motion is stopped.

3.6.6 **Zone Ring**

The zone ring monitors the position of the robot’s S-Axis. As the robot moves from Station 1 to Station 2, a signal is output to the XRC informing it of the robot’s position. This output and a signal from the operator door are interlocked with the “OK TO WORK” output, preventing the robot from welding when the operator door is open.

3.6.7 **Brake Release**

**WARNING!**

*Releasing brakes could cause personal injury or machine damage. Always support the axis to be released BEFORE you release it.*

The Brake Release Control is a safety feature that releases the automatic brakes on the robot in case of an emergency or robot failure.
3.6.8 **Interference Cubes**

Cubic interference zones prevent interference between multiple manipulators or a manipulator and peripheral devices. The XRC 2001 controller monitors the robot tool center point (TCP) during operation. If the TCP enters one of these software-defined interference zones, an output is turned on in the XRC 2001. These outputs can be used to interlock the activity of other manipulators or peripheral devices. The XRC 2001 controller has eight possible cubes available. These cubes are internally tied to the following **Specified Outputs**:

\[
R1 = \text{SOUT} \#081 - 104
\]

The ArcWorld II-200 uses interference cubes to interlock robot position with positioner motion. The robot Home or Safe position (Cube 23 and Cube 24) is defined behind the positioner, clear of the sweep zone. Before the positioner can sweep, the robot must be in this safe position.
SECTION 4
INSTALLATION

The ArcWorld system can be installed easily in just a short time by three workers. The more people involved (within reason), the more quickly installation can be completed. Follow established safety procedures at all times throughout the installation process. Failure to use safe work practices can result in damage to the equipment and injury to the workers.

CAUTION!
Installation of the ArcWorld System is not a task for the novice. The ArcWorld System is not fragile, but it is a highly sophisticated robotic system. Handle components with care. Rough handling can damage system electronic components.

4.1 Materials Required
All system hardware necessary for installing the ArcWorld system is included with the system. This section identifies customer-supplied items and tools required to complete installation.

4.1.1 Customer-Supplied Items
- Gas bottles for the welding torches
- Incoming power supply
- Two earth ground cables with two earth ground stakes
- Weld wire
- Incoming air supply: 0.04 cm at 620.5 kPa (1.5 scfm at 90 psi)
- Stepladder
- Forklift and/or overhead crane

4.1.2 List of Tools
- Safety glasses
- Face shields
- Gloves
- Level
- Ratchet with 3/4-in. socket
- Adjustable wrench set
- Hammer drill with appropriate concrete bits
- Phillips and flat screwdrivers
- Hammer
- Socket set
- Forklift and/or overhead crane
- Air-impact gun with 3/4-in. socket
- Open-end wrench set
- Two socket-head (Allen)
- Wrench sets (standard and metric)
4.2 Site Preparation

To prepare your site, proceed as follows:

1. Clear floor space needed for unit (see Figure 4-1).

**NOTE:**
The ArcWorld II-200 system will require a minimum area of 2.2 m (7.25 ft) by 4.6 m (15 ft). To make installation easier, however, an additional 2.43 to 3.05 m (8 to 10 ft) on all sides is recommended.

2. Gather all customer-supplied items and required tools listed in Section 4.1.

![Figure 4-1 Area Needed for Installation](image-url)
4.3 Installing the Robot/Table Cell

The ArcWorld II-200 robot/table cell — complete with robot, torch, two weld tables and fencing with arc curtains — is shipped on a large wooden shipping skid.

4.3.1 Installing the Robot/Table Common Base

CAUTION!
Handle ArcWorld II-200 components carefully to avoid damage.

To install the robot/table common base:

1. Unbolt the robot/table common base from the wooden shipping skid using a 3/4-inch socket (see Figure 4-2).

WARNING!
The robot/table common base weighs 2,041 kg (4500 lbs). Be sure that your crane or forklift is capable of handling this much weight or damage to the equipment or injury to personnel can result.

2. Using a forklift, remove common base from wooden shipping skid.
3. Place robot/table common base in position (see Figure 4-1).
4. Carefully remove protective plastic wrapping from robot and torch.
5. Inspect robot, torch, and weld tables for shipping damage.

NOTE: If damage is found, notify shipper immediately.
4.3.2 Removing the Shipping Brackets

**CAUTION!**
*Failure to remove shipping brackets from robot before operating the ArcWorld II-200 may result in damage to the robot drive mechanisms.*

Three yellow brackets (see Figure 4-3) prevent the robot from moving during shipping. Two rod brackets secure the lower arm assembly to the S-axis housing. The smaller bracket on the rear of the robot prevents the S-axis housing from pivoting. After the robot is in place, remove the shipping brackets.

*Figure 4-3 Location of Shipping Brackets*
4.4 Installing the Auxiliary Equipment Common Base

The auxiliary equipment common (AEC) base contains the XRC controller and the welding power source. It may also include the optional water circulator and/or Com-Arc III unit. The AEC base is shipped on a separate wooden shipping skid. The accessories box is secured to the top of the welding power source. To install the AEC base, proceed as follows:

1. Unbolt AEC base from wooden shipping skid by removing four shipping bolts using 3/4-inch socket (see Figure 4-4).

**WARNING!**
The AEC base weighs 680 kg (1500 lbs). Be sure that your crane or forklift is capable of handling this much weight or damage to the equipment or injury to personnel can result.

2. Using a forklift, lift base and remove it from wooden shipping skid.

3. Place AEC base to the left of the ArcWorld II-200 cell (see Figure 4-5).

**NOTE:** The auxiliary equipment common base can be located directly to the left of the cell. No space is needed between it and the robot/table common base.
4. Carefully remove plastic wrapping and cardboard from AEC base.

5. Remove any accessories boxes from welding power source and set them safely aside.

6. Inspect AEC base for any shipping damage.

**NOTE:** If damage is found, notify shipper immediately.

### 4.5 Leveling and Securing the Equipment

After everything is in position, level the equipment and secure it to the floor. The lag bolts are shipped in the accessories box. To level and secure the equipment, proceed as follows:

1. Level robot/table common base by adjusting leveling bolts (see Figure 4-10).
2. Insert a 1/2-inch concrete drill bit through center of leveling bolts and drill holes for lag bolts.
3. Vacuum concrete dust from holes.
4. Lag robot/positioner common base to floor.
5. Level auxiliary equipment common base by adjusting leveling bolts (see Figure 4-11).
6. Insert a 1/2-inch concrete drill bit through center of leveling bolts and drill holes for lag bolts.
7. Vacuum concrete dust from holes.
8. Lag auxiliary equipment common base to floor.

**Figure 4-6 Leveling Bolts**

**Figure 4-7 Auxiliary Equipment Common Base Leveling Bolts**
4.6 Connecting the Cables

After components are level and securely in place, the cables should be unwrapped from around the equipment and laid out according to the cable diagram included in the system drawing package. Each cable connection is clearly identified for ease of installation.

⚠️ CAUTION!
Route wires and cables away from hazardous work areas to avoid wire breakage and unnecessary interruption of cell operation.

4.6.1 Connecting the Earth Ground

The robot and the XRC must each be connected to an earth ground. An earth ground is a ground in which the equipment is connected to a ground stake driven into the earth. The ground stake must be driven a minimum of eight feet into the earth, and the earth must be treated with chemicals in order to reduce resistance to the ground stake. Deeper ground stakes may be required depending on area soil conditions. A maximum of 100 ohms ground resistance is recommended. To ground the robot and the XRC, proceed as follows:

⚠️ WARNING!
- If proper earth grounds cannot be provided, do not use the equipment! Serious injury or death can occur.
- Do not place the MIG system within 50 feet of other sources of noise (i.e., GTAW arc starters, plasma cutters, induction furnaces, high-power-resistance spot welders, dielectric heaters, etc.). Equipment that generates impulse or high-frequency noise can cause unexpected equipment operation and failure, which can result in serious injury or death.

**NOTE:** If the robot and the XRC are within 15 feet of each other, a common earth ground may be used. Otherwise, separate earth grounds must be used.

1. Connect one end of robot earth ground cable to lug marked EARTH GROUND on bottom back of robot.
2. Connect other end of robot earth ground cable to earth ground stake.
3. Connect one end of second earth ground cable to common ground bus bar inside XRC.
4. Connect other end of second earth ground cable to earth ground stake.

4.6.2 Connecting the Robot Cables

Two cables, 1BC and 2BC, connect the robot to the XRC controller. The 1BC cable supplies power to the robot servo motors. The 2BC cable provides communication between the controller and the robot. To connect the robot cables, proceed as follows:

**NOTE:** The right side of the XRC is on your right as you are facing the front of it.

1. Unpack programming pendant and plug connector into receptacle on right side of XRC controller.
2. Unpack two large black manipulator cables, connected to XRC controller, and route to back of robot.

3. Carefully engaging connectors, connect two cables (labeled 1BC and 2BC) to 1BC and 2BC connections on back of robot (see Figure 4-12).

4.6.3 Connecting the System

The system interface box is mounted on the back of the system fencing. To connect the system interface box, proceed as follows:

1. Locate and unpack two Door Switch cables and connect to sides of interface box.
2. Unpack safety mat cable and connect between the safety mat junction box and the interface box.
3. Unpack operator station cable and connect to interface box.
4. Unpack two positioner cables from interface box and connect to left side of XRC cabinet.

4.6.4 Connecting the Com-Arc III and the Wire Cutter (Optional)

The Com-Arc III and the wire cutter are options. Typically, the wire cutter is installed on the optional torch tender. The Com-Arc III cable is connected to the left side of the XRC (see Figure 4-15). The wire cutter cable is connected on the right side of the XRC (see Figure 4-14). The Com-Arc III is usually shipped with its cables connected. To connect the wire cutter:

1. Unwrap wire cutter cable.
2. Plug wire cutter cable into connector on wire cutter unit.
3. Connect wire cutter to an air supply set at 85 to 100 psi.

Figure 4-8 Connecting Robot to XRC Controller
For detailed installation and operation instructions for the Com-Arc III, refer to the Com-Arc III Instruction Manual (P/N 132753-1).

4.6.5 **Connecting Water Circulator (Optional)**

If your system uses the water cooled welding torch, it is necessary to connect the Motoman water circulator. To connect the water circulator, proceed as follows:

1. Connect two water hoses from weld torch to connections on water circulator marked WATER-IN and WATER-OUT (see Figure 4-9).

![Figure 4-9 Water Circulator Connections](image)

**CAUTION!**

- Use only the antifreeze provided by Motoman. Automotive antifreeze contains stop-leak additives that will clog the small torch water-cooling ports and damage the gaskets in the pump.
- Do not fill the water circulator past its fill line. Damage to the water circulator could occur.

2. Fill water circulator tank with antifreeze coolant provided (P/N 131224-1).
3. Plug power cable into electrical outlet on back of power source.

4.6.6 **Connecting the Pneumatic Cylinder Air Lines**

The stationary table air lines are regulated by the FRL (filter/regulator/lubricator) and are installed beneath each table, as shown in Figure 4-16. The customer is responsible for providing and installing the air line connector fitting to the FRL. After the fitting is installed, connect the air line. The incoming air supply should be 0.04 cmm at 620.5 kPa (1.5 scfm at 90 psi).
4.7 Connecting the Power

After all of the system components have been properly installed, connect the power to the ArcWorld II-200. To connect incoming power to the ArcWorld II-200, proceed as follows:

**DANGER!**

*Power should be connected only by a qualified electrician. Electrical and grounding connections must comply with applicable portions of the national electrical code and/or local electrical codes.*

1. Install 3-phase power wiring to the circuit breaker located inside the right wall of the XRC cabinet (see Figure 4-11). Table 4-1 shows the size and type of wire needed.
2. Tighten screws to the torque indicated in Table 4-1.
3. Install an M5 lug on the incoming ground wire.
4. Terminate the ground wire to the frame ground M5 threaded stud with M5 hardware provided.

**NOTE:** The ArcWorld II-200 is configured for three-phase 460/480V AC, unless other voltage was requested. If other voltage is required for your plant, you must make the necessary modifications to the transformer. For more information, refer to the manipulator manual that came with your system.

### Table 4-1 Incoming Power Specifications (Decal)

<table>
<thead>
<tr>

<td>#14-7, 4.0 N•m (35 lb-in.)</td>
</tr>
</tbody>
</table>
4.8 **Conducting a Safety/Operation Check**

Before installing the tooling and fixtures for your application, take a few minutes to perform a safety/operation check. To conduct a safety/operation check, proceed as follows:

1. Check that all shipping brackets have been removed from robot (see Section 4.3.2).
2. Check that cell door is closed and latched.
3. Check that all cable connections are tight.
4. Check air line connections to the optional torch tender and wire cutter.
5. Be sure welding power source is set correctly (see welding power source vendor's manual).
6. Verify incoming line power matches input power specified on front of XRC.

Your ArcWorld II-200 is now ready for power-up. The ArcWorld system should be operated only by personnel who have received operator training from Motoman and who are familiar with the operation of this Motoman robot model. Turn the main power ON, and continue the safety/operation check.

7. Check all system E-STOPS (pendant, operator station, breakaways, playback panel).
8. Check system Hold buttons.

4.9 **Installation of Tooling and Fixtures**

Your ArcWorld II-200 system is now ready for the installation of tooling and fixtures for your application. Installation of tooling and fixtures should be performed by personnel who are familiar with the operation of this system. Tooling and fixtures are supplied by the customer. After tooling is installed, test the positioner for proper operation:

- Verify FRL is set for 620.5 kPa (90 psi).
- Operator doors achieve full sweep time (4 to 5 seconds).
The ArcWorld II-200 is a fully integrated robotic GMAW welding cell. The robot welds on one station while the operator loads the other station with parts. Once the robot is finished welding, it returns to the safe position (Cube 24), the operator doors cycle, and the robot begins welding on the other station. The operator can now safely remove the welded piece and load new production parts onto the station.

This section provides operating procedures for the ArcWorld II-200 system. These include the following:

5.1 Programming

The operation of this system is programming dependent. The following operating instructions are based on one possible configuration of this system. Your system configuration and job structure may differ slightly from that presented here, however basic operation will be the same.

Any changes made to your system configuration and/or job structure will alter the operation of this cell. Motoman recommends you do not modify the original jobs and system configuration that came with your system. If modifications need to be made, they should be made to copies of these jobs and not to the originals. Modifications should only be performed by personnel who have received operator training from Motoman, and who are familiar with the operation of this Motoman system. If you have questions concerning the configuration of your system please contact the 24 hour Service Hotline, at (937) 847-3200 (see Section 1.4).

5.1.1 I/O Assignment

The ArcWorld II-200 uses the following user and dedicated inputs and outputs (see Tables 5-1 and 5-2).

<table>
<thead>
<tr>
<th>XRC Dedicated Inputs</th>
<th>XRC Dedicated Outputs</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>• External Emergency Stop</td>
<td></td>
</tr>
</tbody>
</table>

For more information on user and dedicated I/O, refer to the XRC Concurrent I/O Parameters Manual (P/N 142102-1).
5.2 Daily Operation

The procedures below represent the typical operating sequence from power up to shutdown. Your basic operating procedures may vary depending on your situation.

- Perform Start-up Procedures (see Section 5.2.1).
- Move Robot to Safe Position (see Section 5.2.2).
- Selecting Master Job (see Section 5.2.3).
- Perform Operation Cycle (see Section 5.2.4).
- Perform Shutdown Procedures (see Section 5.2.5).

</tbody>
</table>
5.2.1 Start-Up

To start up the ArcWorld cell from a Power-Off condition, proceed as follows:

1. Turn on welding power source disconnect.
2. Set MAIN POWER switch on XRC to ON.
3. Set INPUT POWER switch on welding power source to ON.
4. Open regulator valve on welding gas supply.
5. Make sure both enclosure doors are closed and securely latched.
6. Disable operator station.
7. Press TEACH mode button on XRC playback panel.
8. Place robot in Safe position (Cube 24).

5.2.2 Robot Safe (Cube 24) Position

To move the robot to the Safe position (Cube 24), proceed as follows:

1. Press TEACH mode button on XRC playback panel.
2. Press TOP MENU on programming pendant.
3. Select JOB icon using cursor keys and press SELECT.
4. Cursor to SELECT JOB and press SELECT key.
5. Using cursor keys, move cursor to Cube 24 job and press SELECT. Cube 24 job appears on display screen.
6. Turn servo power ON by pressing SERVO ON, pressing TEACH LOCK and holding in ENABLE switch.
7. Use INTERLOCK and FWD buttons on programming pendant to jog robot to Safe (Cube 24) position.

5.2.3 Starting the Master Job

With the system powered up and in TEACH mode, call up the Master job, then...

1. Press TOP MENU key on programming pendant.
2. Select JOB icon using cursor keys and press SELECT.
3. Cursor to SELECT JOB and press SELECT key. Job list appears on display screen.
4. Using cursor keys, move cursor to Master job and press SELECT. Master job appears on display screen.
5. Make sure both enclosure doors are closed and securely latched.
6. Press PLAY mode button on XRC playback panel. Job playback operation is enabled.
7. Press SERVO ON button on playback panel.
8. Reset positioner by simultaneously pressing RESET and right CYCLE START buttons on operator station.
9. Place ENABLE/DISABLE switch on operator station in ENABLE position. XRC is placed in REMOTE mode and system control is transferred to operator station.

The ArcWorld II-200 cell is now ready for operation.
5.2.4 Perform Operation Cycle

By default, the operator doors of both weld stations will rest in the down position to permit parts loading. This condition will occur only when the robot is in the Safe position (Cube 24) and CYCLE START has not been activated on either station.

1. Load Station 1 (station on the right) with production parts.
2. Press the CYCLE START button on Operator Station 1. The operator door rises, and the robot moves to the Home 1 position.
3. The XRC waits for the “OK TO WORK” input, signaling that the operator door is up and the robot is in Zone 1.
4. The robot moves into the work area and begins welding. When the robot has finished welding, it returns to the Safe position, then proceeds to Station 2. As soon as the robot has left Station 1, the operator door lowers giving the operator access to the welded parts on Station 1.
5. While the robot is welding at Station 1, load Station 2 (station on the left) with production parts.
6. Press the CYCLE START button on Operator Station 2. The operator door rises. The robot begins welding at Station 2 as soon as it has finished welding at Station 1.
7. While the robot is welding on Station 2, unload the welded parts from Station 1 and load new parts.
8. Activate CYCLE START to raise the operator door and permit the robot to return to Station 1.

NOTE: The robot will not return to Station 1 until CYCLE START has been activated, even if it has completed work at Station 2. If the robot finishes working at Station 2 before Station 1 is reloaded, the robot will return to the Safe position (Cube 24) and wait for a CYCLE START command from either station.

Once all production work is finished and the robot completes work on the last station, the robot returns to the Safe position and both operator doors open to permit unloading/loading. The doors remain in the down position until CYCLE START is activated at one or both stations.

5.2.5 Shutdown

Use the following procedure to shut down the ArcWorld II-200 cell after operation is complete:

1. Make sure the robot is in the Safe position (Cube 24).
2. Turn off system servo power by pressing E-STOP button on operator station, programming pendant, or playback panel.
3. Press TEACH mode button on playback panel.
4. Set controller Main Power switch to OFF position.
5. Set Main Power switch on welding power source to OFF position.

The ArcWorld II-200 cell is now shut down.
5.3 System Recovery

Under certain conditions you will be required to clear an alarm or error. The paragraphs below describe the different types of alarms and errors you may encounter and how to remedy them when you do.

5.3.1 Alarms and Errors

Alarms and errors will cause the program to stop. There are three levels of alarms and errors: Error Messages, Minor Alarms, and Major Alarms. For more detailed information about alarm recovery, refer to manipulator manual that came with your system.

Error Messages

These are simple errors such as pressing the START button when the robot is not in PLAY mode, or enabling the programming pendant without the servo power being live. Errors like these are cleared by pressing the CANCEL button on the programming pendant.

Minor Alarms

Minor alarms are usually programming errors. Minor alarms might occur if a circle has been programmed with fewer than three circular points, etc. These alarms are cleared by pressing the RESET (F5) soft key on the programming pendant.

Major Alarms

Major alarms are hardware failures. Major alarms might occur because of a servo tracking error or an abnormal speed and are usually associated with crashes. To clear these alarms, you must turn off the controller and then turn it on again.

5.3.2 Shock Sensor Recovery

The ArcWorld welding package includes a Motoman gun mount. This mount is designed to protect the torch from damage in case of a crash. A slight deflection of the torch activates a SHOCK SENSOR message, which triggers an E-STOP condition. To clear the E-STOP condition, you must override the shock sensor and move the robot clear of the impact. To override the shock sensor, proceed as follows:

CAUTION!
It is possible to crash the robot with the Shock Sensor Override Switch left in the “Override” position. Always remember to reactivate the Shock Sensor before continuing system operation.

1. Press TOP MENU on programming pendant.
2. Select ROBOT icon using cursor keys and press SELECT.
3. Cursor to OVERRUN-S.SENSOR and press SELECT key.
4. Select RELEASE to release shock sensor.
5. Turn servo power ON by holding ENABLE switch on the programming pendant and pressing SERVO ON.

NOTE: TEACH LOCK must be ON to turn servo power on in TEACH mode.
The ArcWorld II-200 cell is now ready to continue operation.
5.3.3 **E-STOP Recovery**

An E-STOP can occur under any of the following conditions:

- Pressing the E-STOP button on the operator station, programming pendant, or playback panel.
- Opening sliding door on robot enclosure when robot is in PLAY mode.
- Stepping on safety mat when positioner is sweeping.
- Actuating shock sensor on torch mount.

To restart the ArcWorld II-200 cell after an E-STOP condition occurs, follow the procedure below.

1. To clear E-STOP condition, perform any of the following actions that apply:
   - Release the E-STOP button on the operator station, programming pendant, or XRC playback panel.
   - Close sliding door.
   - Step off safety mat.
   - Clear Shock Sensor condition (refer to Section 5.3.3).

CAUTION!

*If an emergency stop condition occurs while the positioner is sweeping, the positioner will continue the sweep when system is reinitialized.*

2. Press SERVO ON button on operator station, or playback panel.
3. Press RESET button and right CYCLE START button on operator station to initialize system.
4. Ensure operator station is enabled.
5. Press MASTER JOB START button on operator station.

The ArcWorld II-200 cell is now ready to continue operation.
5.3.4 Using the Brake Release

The brake release control panel is located on the front of the XRC. Each axis brake is controlled by an individual axis button. Simultaneously pressing the ENABLE button and one of these axis buttons releases the indicated axis. To release the brakes, proceed as follows:

1. Press E-STOP button on programming pendant, playback panel, or operator station, to be sure servo power is OFF.
2. Provide adequate support for axis to be released. Support should withstand payload of robot and approximate weight of robot. Listed below is the weight of each robot available:
   - UP6 – 135 kg (297 lb)
   - UP20 – 260 kg (573 lb)

**WARNING!**

Releasing brakes could cause personal injury or machine damage. **Always support the axis to be released BEFORE you release it.**

3. Release specific axis brake by pressing and holding corresponding axis button and ENABLE button at same time.

**NOTE:** You must hold both the axis and ENABLE buttons down for the axis to remain released. Releasing either button will automatically lock the brakes again.
6.1 Periodic Maintenance

Table 6-1 provides periodic maintenance items and intervals for the ArcWorld II-200 cell. Keep in mind that the maintenance intervals serve as guidelines only. You should adjust the frequency of maintenance to suit your specific work conditions.

For periodic maintenance procedures and schedules for the individual components of your ArcWorld II-200, refer to the manipulator and additional manuals that came with your system.

CAUTION!

- Use only the antifreeze provided by Motoman. Automotive antifreezes contain stop-leak additives that will clog the small torch water-cooling ports, and damage the gaskets in the water circulator pump.

<table>
<thead>
<tr>
<th>Frequency</th>
<th>Component</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Daily</td>
<td>Water circulator (For water-cooled torch application only.)</td>
<td>Check the fluid in the water circulator. Add fluid as required. Use only distilled water and approved antifreeze (Motoman P/N 131224-1).</td>
</tr>
<tr>
<td>Daily</td>
<td>Air filter/regulator for water (high-humidity environments)</td>
<td>Inspect left glass cylinder for water. If water is present, loosen the valve at the bottom of the cylinder to expel any moisture.</td>
</tr>
<tr>
<td>Weekly</td>
<td>Air filter/regulator oil level</td>
<td>Inspect right glass cylinder and transparent neck on the top of the regulator. If oil falls below half, add oil.</td>
</tr>
</tbody>
